120609 Structural study of the cis-to-trans thermal isomerization in polyacetylene. P.Robin (Lab. Central de Recherches, Thomson-CSF, Orsay, France), J.P.Pouget, R.Comes, H.W.Gibson, A.J.Epstein.
J. Phys. Colloq. (France), vol.44, no.C-3, p.77-81 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
An X-ray study of the cis to trans thermal isomerization in polyacetylene is given. It shows that the isomerization process is homogeneous without clustering of trans regions within the cis host lattice. (14 refs.)

120610 Models for the kinetics of cis-trans isomerization in polyacetylenes. O.Parodi (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.119-22 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Two models are proposed for thermal isomerization. The first one is a growth model with random nucleation. The second one is a pure random model. This second model is the only one to account for the differences in characteristic times obtained from different experimental techniques. (6 refs.)

120611 Cis-trans isomerization of polyacetylene. H.W.Gibson, R.J.Weagley, W.M.Prest,Jr., R.Mosher, S.Kaplan (Webster Res. Center, Xerox Corp., Webster, NY, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.123-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The isomerization of polyacetylene from the cis to the trans form has been monitored by Fourier transform infrared spectroscopy (FTIR) and by magic angle ^{13}C nuclear magnetic resonance spectroscopy (NMR). The importance of using thin films (<10 μm) for determination of the isomeric composition with grating IR instruments is emphasized. A method utilizing integrated intensities (areas) of the IR peaks at 740 and 1013 cm^{-1} was developed. NMR data was found to correlate with the FTIR data. The kinetics are not simple. In order to obtain activation energies the correct kinetic equations must be used; such equations will be described elsewhere. Trans units are generated randomly in the cis matrix (NMR evidence). The presence of significant ($\sim$7%) residual cis content even at extended times and temperatures (FTIR evidence) is observed. These facts indicate an average trans sequence length of 15 double bonds or less. (8 refs.)

120612 Stability of iodine-doped polyacetylene in aqueous environments. A.Guiseppi-Elie, G.E.Wnek (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.193-7 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Iodine-doped polyacetylene has been found to display exceptional stability in deaerated, aqueous environments and to degrade in the presence of aqueous nucleophiles with a rate which increases with increasing nucleophilicity. (11 refs.)

120613 Thermal decomposition of iodine doped polyacetylene. S.Pekker, G.Mihaly (Central Res. Inst. for Phys., Budapest, Hungary).
J. Phys. Colloq. (France), vol.44, no.C-3, p.203-5 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Thermogravimetric studies of iodine doped polyacetylene are presented. The weight loss is strongly dependent on the heating rate: at 5°C/min the decomposition is continuous while at 30°C/min an explosion can be observed at the melting point of iodine. The explosion can be explained as a result of exothermic reaction between polyacetylene and liquid iodine. (3 refs.)

120614 EPR and IR investigation on cis-trans isomerization and oxidation of polyacetylene films. A.Zanobi, L.D'Ilario (Assoreni, Rome, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.309-11 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The mechanism of polyacetylene cis-trans isomerization has been investigated. The authors present evidence that the isomerization takes place through the cleavage of a double bond with radical formation and that oxygen catalyses this reaction. (6 refs.)

120615 New synthetic approaches to tetrathiafulvalene derivatives: systematic modifications of BEDT-TTF and TMTTF donors. R.R.Schumaker, V.Y.Lee, E.M.Engler (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1139-45 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
A new synthetic procedure for preparing a variety of substituted tetrathiafulvalene (TTF) derivatives is described which involve a double cyclization reaction to construct the TTF skeleton from the inside out. This method provides a convenient synthesis of per-deuterated tetramethyl-TTF. A variety of chemically modified derivatives of bis(ethylenedithio)-TTF (BEDT-TTF) have been elaborated, including the new donors: bis(ethylenediseleno)-tetraselenafulvalene (BEDSe-TSeF), bis(ethylenedithio)-tetraselenafulvalene (BEDT-TSeF), bis(vinylenedithio)-tetrathiafulvalene (BVDT-TTF), bis(dimethylvinylenedithio)-tetrathiafulvalene (BDVDT-TTF) and bis(2-thiapropylenedithio)-tetrathiafulvalene (BTDPT-TTF). (13 refs.)

120616 BDMT-TXF—a new series of tetrachalcogen fulvalenes. K.A.Lerstrup, D.O.Cowan (Johns Hopkins Univ., Baltimore, MD, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1247-8 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Three new fulvalene donors, bidimethylthiopheno-tetrathiafulvalene, -tetraselenafulvalene, and -tetratellurafulvalene were prepared from 3,4-dibromo-2,5-dimethylthiophene. (4 refs.)

120617 Redox polymeric film formation by oxidation of dibenzo-crown ethers. V.Le Berre, R.Carlier, J.Simonet, A.Tallec (Lab. d'Electrochimie, Univ. de Rennes I, Rennes, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.1269-72 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
New 2-dimensional conducting polymers have been synthetized by anodic oxidation of dibenzo-crown ethers. (2 refs.)

120618 Chlorination of natural rubber vulcanizates in chlorine solutions in halogenated hydrocarbons. J.Perkowski, J.S.Miller (Politech. Lodzka, Lodz, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.129-31 (April 1983). In Polish. [received: Oct. 1983]
It has been shown that the exposure of rubber to the action of Cl_2-solution in carbon tetrachloride causes a decrease in the coefficient of friction without negatively affecting the mechanical properties of rubber. The optimum reaction conditions have been established; they are: duration 10-20 s; Cl_2-concentration in CCl_4-0.06-0.12 wt.%; temperature 293K. A flowsheet of the plant has been presented and guidelines for the design of the chlorination process for the windscreen wipers by this method have been presented. (5 refs.)

120619 Cyclization dynamics of polymers. IX. The effect of polymer concentration on the slowest internal relaxation mode of a labelled polystyrene chain. A.E.C.Redpath, M.A.Winnik (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
Polymer (GB), vol.24, no.10, p.1286-90 (Oct. 1983).
A combination of steady-state and fluorescence decay techniques permits one to measure the dynamics of end-to-end cyclization of a polymer chain substituted at both ends with pyrene groups. In the limit of low concentration, the rate constant for cyclization, k_{cy}, can be identified with the slowest relaxation rate τ_1^{-1} of a Rouse-Zimm chain. Experiments are reported which allow k_{cy} to be examined for two chain lengths of polystyrene substituted on both ends with pyrene groups. These chains have $M_n=9200$ and 25000 ($M_w/M_n\leq1.15$). Added unlabelled polystyrene polymer [PS] causes k_{cy} to decrease in cyclohexane just above the θ-temperature, whereas in toluene, a good solvent, k_{cy} is largely unaffected, even at [PS] concentrations of 50 wt.%. These results are explained in terms of frictional effects-hydrodynamic screening—dominating in the poor solvent, whereas other factors tend to have offsetting effects in the good solvent. (28 refs.)

120620 Selective solvation of polystyrene in tetralin/cyclohexane mixtures. A.Abdel-Azim.Abdel-Azim, M.B.Huglin (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England).
Polymer (GB), vol.24, no.10, p.1308-12 (Oct. 1983).
Refractive index increments and density increments have been measured at 307.6K for polystyrene in binary solvents of 1,2,3,4-tetrahydronaphthalene (tetralin, TET) and cyclohexane over the whole range of solvent composition. Comparison of these increments with the corresponding values obtained at dialysis equilibrium (i.e. at constant chemical potential of low molecular weight species) yielded the coefficients of selective adsorption (γ_1) of TET by the polymer. Positive values of γ_1 were exhibited at solvent compositions up to 78% (v/v) of the thermodynamically better solvent, TET. Theoretical curves of γ_1 vs. composition were calculated on the basis of, firstly, relevant interaction parameters and, secondly, interaction parameters in conjunction with solubility parameters. Both procedures afforded self-consistent results, which were, however, uniformly lower than the experimental values of γ_1. (40 refs.)

120621 Ultrasonic detection of free radicals decay in polyethyl methacrylate. M.Mongy, A.W.Aziz, M.El-Sabee (Nat. Inst. for Standards, Cairo, Egypt).
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.147-50 (1982). [received: Oct. 1983]
Free radical formation and decay in PEMA has been detected by ultrasonic technique. The results obtained, though somewhat different from earlier data, yet they support the idea that the ultrasonic measurement is a sensitive method for detecting the formation and decay of free radical in polymers. (9 refs.)

120622 Le Chatelier principles of stable chemical equilibrium. II. Reactions in ideal gaseous phase. F.C. Olivera (Univ. Simon Bolivar, Caracas, Venezuela).
Scientia (Chile), vol.46, no.156-157, p.41-9 (Jan.-Dec. 1981). In Spanish. [received: Sept. 1983]
Equations previously derived for the stable equilibrium of chemically reactive systems are applied to the simple case of ideal mixtures of perfect gases. It is shown that the addition of a small amount of any component changes the equilibrium state so as to decrease the mole fraction of the same component. Depending on the initial composition, this behaviour may for some reactions result in an actual decrease in the equilibrium conversion when a reactant is added to, or a product is removed from, the reacting mixture. (8 refs.)

120623 Synergistic effects for the $TiO_2/RuO_2/Pt$ photodissociation of water. G.Blondeel, A.Harriman, D.Williams (Davy Faraday Res. Lab., Royal Inst. London, London, England).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.217-27 (July-Sept. 1983).
Compressed discs of naked TiO_2 or TiO_2 coated with a thin film of a noble metal (e.g. Pt) do not photodissociate water upon illumination with UV light but small amounts of H_2 are generated if the TiO_2 has been reduced in a stream of H_2 at 600°C. Discs prepared form mixtures of TiO_2/RuO_2 facilitate the UV photodissociation of water into H_2 and O_2 although the yields are very low. When a thin (ca. 9 nm) film of Pt is applied to the TiO_2/RuO_2 discs the yields of H_2 and O_2 observed upon irradiation with UV light are improved drastically. In this paper, the authors attempted to verify that both RuO_2 and Pt are mandatory for efficient photodissociation of water with n-type TiO_2 and, without extensive analytical evaluation of particulate material, the only way that this can be shown is by the use of macroelectrodes. (25 refs.)

120624 Location of transition states and stable intermediates by MINIMAX/MINIMI optimization of synchronous transit pathways. A.Jensen (Inst. fur Organische Chem., Johannes Gutenberg-Univ., Mainz, Germany).
Theor. Chim. Acta (Germany), vol.63, no.4, p.269-90 (1983).
The MINIMAX/MINIMI concept of the location of transition states and/or stable intermediates of chemical reactions is introduced, based on the synchronous transit method. According to this strategy, minimization of quadratic synchronous transit path maxima or minima is achieved by constrained exhaustive optimization of internal coordinates. The method and its efficiency are demonstrated for two-dimensional model surfaces as well as for thermally allowed electrocyclic interconversions of cyclopropyl-/allyl-cation and cyclobutene-/butadiene (gauche) within the framework of MNDO-SCF calculations. Thus, in both cases a direct comparison with the exact solution determined by minimization of the scalar gradient norm and cross reference to the original work of Halgren and Lipscomb 1977 is possible. (21 refs.)

120625 Chemical applications of topology and group theory. XIV. Topological aspects of chaotic chemical reactions. R.B.King (Dept. of Chem., Univ. of Georgia, Athens, GA, USA).
Theor. Chim. Acta (Germany), vol.63, no.4, p.323-38 (1983).
For pt.XIII see ibid., vol.63, p.103-32 (1983). Earlier approaches to the analysis of chemical dynamic systems using kinetic logic are defined to deal more effectively with systems having the two or more feedback circuits required for chaos. The essential kinetic features of such system can be represented by a directed graph (called an influence diagram) in which the vertices represent the internal species and the directed edges represent kinetic relationships between the internal species. Influence diagrams characteristic of chaotic chemical systems have the following additional features: (1) they are connected; (2) each vertex has at least one edge directed towards it and one edge directed away from it; (3) there is at least one vertex, called a turbulent vertex, with at least two edges directed towards it. (33 refs.)

120626 Radiochemical investigation of the gas-phase interaction of free butyl cations with benzene under enhanced pressure. V.D.Nefedov, E.N.Sinotova, Yu.M.Arkhipov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.109-12 (Aug. 1983). In Russian.
Sec-butylbenzene is the main product of the gas-phase butylation of benzene by free *n*-butyl cations in the pressure range 90-310 kPa. *N*-butyl cation isomerization is estimated to take place in less than 10^{-10} s. (3 refs.)

82.35 POLYMER REACTIONS AND POLYMERIZATION

120627 Polymerization of acetylene with new catalysts, new doping agents, morphology and electrical conductivity of the doped polyacetylene films. F.Schue, M.Aldissi (Lab. de Chimie Macromoleculaire, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), J.C.Dubois, L.Giral, M.Roland, J.Sledz.
J. Phys. Colloq. (France), vol.44, no.C-3, p.17-19 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The catalytic activities of WCl_6-Ph_4Sn, $MoCl_5-Ph_4Sn$ and tetrabenzyltitanium were examined in the polymerization of acetylene. (9 refs.)

120628 Insertion of $FeCl_4^-$, $AlCl_4^-$ and HSO_4^- ions into polyacetylene—study of the reaction conditions and properties of the products. J.Przyluski (Dept. of Chem., Tech. Univ. of Warsaw, Warsaw, Poland), D.Billaud, M.Zagorska, C.Budrowski, A.Pron.
J. Phys. Colloq. (France), vol.44, no.C-3, p.29-32 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The electrochemical intercalation of $FeCl_4^-$ and AlC_4^- ions into polyacetylene is reported. After exposure to air, polyacetylene tetrachloroferrates are much more stable than polyacetylene tetrachloroaluminates. The chemical intercalation of HSO_4^- into polyacetylene from H_2SO_4 vapours is described. The action of water on the polyacetylene hydrogen sulfates formed is discussed. (5 refs.)

120629 Synthesis of graft and block copolymers containing $(CH)_x$ segments. G.F.Dandreaux, M.E.Galvin, G.E.Wnek (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.135-8 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Two approaches have been investigated to expand the scope of polyacetylene derivatives, namely (1) the use of doped $(CH)_x$ as a macromolecular initiator for the synthesis of graft copolymers, and (2) transformation reactions as a route of block copolymer syntheses. (9 refs.)

120630 A new 'processable' polyacetylene modification. J.Hocker, G.Schneider (Zentrale Forschung und Entwicklung, Bayer AG, Leverkusen, Germany).
J. Phys. Colloq. (France), vol.44, no.C-3, p.147-9 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Using a special catalyst on the Ziegler-Natta basis and special reaction conditions it is possible to polymerize acetylene for obtaining a new polyacetylene modification with burr- or fibre-shaped particles which can be processed to foils, non-wovens and coatings. (4 refs.)

120631 Molecular weight and kinetics of acetylene polymerization. M.A.Schen, J.C.W.Chien, F.E.Karasz (Dept. of Polymer Sci. & Engng., Univ. of Massachusetts, Amherst, MA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.163-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The molecular weight of polyacetylene initiated by $Ti(OBu)_4/4N(Et)_3$ catalyst was studied by radioquenching using CH_3O^3H. The effects of Al/Ti ratio, catalyst ageing, catalyst concentration, polymerization temperature, and monomer pressure on the polymerization were investigated. Concurrently, studies using ^{14}CO as the radioquenching agent to count the number of active

sites (C) and CH_3O^3H to determine the total metal polymer bonds (MPB) have defined the kinetics. The authors' interpretation of the results lead to the postulation that the active species C_1 is initially extremely reactive and that within 30 minutes are all converted, through bimolecular kinetics, to a much less active species C_2. (6 refs.)

120632 Semiconductor properties of the anodic polymer obtained on platinum from selenocyanate ammoniate. M.Bragadin, G.Scarponi, F.Ossola (Univ. Venezia, Venezia, Italy), F.Pucciarelli, M.G.Bettoli.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1357-9 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Evidence is given that the deposit obtained from anodic oxidation of selenocyanates is a polymer with a semiconductor-like behaviour. (9 refs.)

120633 Synthesis of cast urethane elastomers for the formation of gaskets on stoneware pipes by the method of casting. E.Halasa (Politech. Rzeszowska im. I. Lukasiewicza, Rzeszow, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.126-9 (April 1983). In Polish. [received: Oct. 1983]
The effect of some selected Rokopol-type polyetherols and catalysts on the time of gelation, time to dust dryness, mechanical properties and resistance of cast urethane elastomers (LEU) to the action of dilute acids and alkalis has been investigated. The best raw material for the preparation of LEU is Rokopol M12, a block copolymer of propylene oxide and ethylene oxide reacted with glycerol, with $M_n = 4700$. (3 refs.)

82.40 CHEMICAL KINETICS AND REACTIONS: SPECIAL REGIMES

120634 Effect of oxidation on the calorific value and spontaneous ignition of stored coal. V.Dusak.
Energetika (Czechoslovakia), vol.33, no.8, p.386-91 (Aug. 1983). In Czech.
Losses caused by oxidation of coal in dumps cannot be replaced nor reliably computed at the present time. Deterioration of coal takes place when oxygen is absorbed from the air and result in subsequent oxidation of the coal. Oxidation begins from the time the coal is disintegrated from the seam, when it is most intensive, and continues up to consumption of the coal. Oxidation is speeded up by a number of factors, such as temperature; as it increases the amount of oxygen also increases. Oxidation causes diminishing of the value of combustion heat and heat content of the coal. Lowering of these values corresponds to the smaller content of carbon and hydrogen. (42 refs.)

82.45 ELECTROCHEMISTRY AND ELECTROPHORESIS

(see also 66.10 Ionic conduction in liquids; for electro-osmosis, see 82.65)

120635 The photoactivity of porous TiO_2 anodized at a high voltage. D.Miller, S.Mamiche-Afara, M.J.Dignam, M.Moskovits (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.236-40 (9 Sept. 1983).
The photoactivity of TiO_2 produced by high-voltage anodization as described by Marchenoir et al. (1980) was compared to single-crystal TiO_2. The anodic oxide film was found to be highly porous. The photocurrent and quantum yield of the anodic sample is markedly larger on the long-wavelength side of the action spectrum as compared to single-crystal rutile. The authors ascribe this behavior either to the formation of anatase 'pockets' in the film or to the incomplete oxidation of Ti during the anodization process. (35 refs.)

120636 Influence of diffusion of electrophoretic deposition in a uniform electric field. V.A.Malov (Lensovet Leningrad Technol. Inst., Leningrad, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.941-4 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1069-72 (Nov.-Dec. 1982). [received: Sept. 1983]
An equation for calculating the weight of an electrophoretic deposit with consideration of the thermal motion of the particles has been obtained. The diffusion flows of the particles accompanying electrophoretic deposition in a uniform electric field influence the laws of deposition when $v^2t/4D \lesssim 5$, where v is the electrophoresis rate, D is the diffusion coefficient of the particles, and t is the time of action of the field. (8 refs.)

120637 Electrolytic oxidation of cerium: improvements in the technology and the uses and applications of such a process. J.-Y.Dumousseau, J.Grosbois, J.Helgorsky (Centre de Recherches, Rhone-Poulenc Recherches, Aubervilliers, France).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.675-6 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given. Numerous oxidizers such as O_3, H_2O_2, Cr^{6+} and MnO_2 are used in organic oxidation reactions. Cerium (IV) is rarely used despite its wide range of redox potentials (from 1.44 V with respect to the normal hydrogen electrode (NHE) in sulphate media to 1.82 V (NHE) in perchlorate media). However, a number of workers have reported the use of cerium (IV) to oxidize organic compounds, e.g. 1,4-naphthoquinone from naphthalene and benzaldehyde from toluene. All these processes have failed because the cerium (IV) salt cannot be regenerated from the cerium (III) salt after the organic oxidation. Many research groups have investigated the electro-oxidation of cerium, but none of them has been able to develop an industrial process. Therefore an electrolytic cell to solve this problem is being investigated and developed. A filter-press electrolytic cell which is compatible with a nitrate or a sulphate electrolyte is used. Cerium is oxidized in the anolyte and the protons are reduced to hydrogen in the catholyte. The two compartments of the cell are separated by a cationic membrane which allows transfer of the protons from the anolyte to the catholyte to form the current.

120638 Effect of radial diffusion on the polarization at porous flow-through electrodes. B.G.Ateya (Chem. Dept., Univ. of United Arab Emirates, Al-Ain, Abu Dhabi).
J. Appl. Electrochem. (GB), vol.13, no.4, p.417-27 (July 1983).
The effect of radial diffusion on the polarization of porous flow-through electrodes has been investigated with the aid of a mathematical model. The proposed model takes into consideration the rates of mass transfer in the axial direction by convection and in the radial direction by diffusion as well as charge transport in the pore electrolyte and electron transfer kinetics at the electrode-electrolyte interface. Normalization of the variables gave rise to dimensionless groups pertinent to the kinetic, ohmic and radial diffusion effects. These are, respectively, I the reversibility index, Δ the parameter of ohmic effect and ψ the parameter of radial diffusion. The latter ($\psi = 2\ \phi/Sh$) is the ratio of two other dimensionless groups. With this formulation, larger values of ψ correspond to more predominant control of the electrode behaviour by radial diffusion. The same is also true for the parameter of ohmic effect Δ. Solutions have been obtained for two limiting cases: negligible and significant potential drop in the pore electrolyte. In both cases, equations have been derived which give the quantitative (highly non-linear) effect of ψ on the current-polarization relations. In the case of a significant ohmic potential drop in the pore electrolyte, it was found that the controlling parameter is the product $\Delta\psi$. The two variables seem to give a synergistic effect since, at large Δ values, a certain change in ψ has a more pronounced effect on the polarization than the corresponding change at lower Δ values. Qualitative and quantitative tests of some aspects of the model are reported using the electrochemical reduction of copper ions from acid copper sulphate solutions at a packed bed of copper particles. Satisfactory agreement was obtained. (19 refs.)

120639 Effect of flow rate and constant operating current on the behaviour of a recirculating electrochemical reactor system. L.H.Mustoe (Dept. of Chem. Engng., Loughborough Univ. of Technol., Loughborough, England), A.A.Wragg.
J. Appl. Electrochem. (GB), vol.13, no.4, p.507-17 (July 1983).
A theoretical analysis is presented for the current-time, voltage-time and power-time relationship and for the energy requirement and process time for the cathodic extraction of copper in a porous flow-through electrode operated as a batch recirculation system under galvanostatic conditions. The anode reaction considered is O_2 evolution and the secondary cathode reaction is H_2 evolution. The copper extraction is under diffusion control, plug flow is assumed in the reactor and perfect mixing in the reservoir. Comparison is made with the case of operation at the limiting current throughout the process duration. (12 refs.)

120640 Electrogeneration of Mn(III) in an undivided cell. J.H.Wagenknecht, J.P.Coleman, R.C.Hallcher, D.E.McMackins, T.E.Rogers, W.G.Wagner (Corporate Res. Labs., Monsanto Co., St. Louis, MO, USA).
J. Appl. Electrochem. (GB), vol.13, no.4, p.535-40 (July 1983).
The electrochemical oxidation of manganous ion to manganic ion in acetic acid may be efficiently carried out in a parallel plate undivided cell. Reduction of manganic ion to manganous ion at the cathode is a relatively inefficient reaction, allowing the formation of solutions of manganic ion as high as 0.05 mol dm^{-3}, at greater than 80% current efficiency. The effects of the major variables have been evaluated. (36 refs.)

120641 On the microstructure of teflon-bonded platinum-carbon electrodes. R.Holze (Inst. of Phys. Chem., Univ. of Bonn, Bonn, Germany), A.Maas.
J. Appl. Electrochem. (GB), vol.13, no.4, p.549-51 (July 1983).
Proposes a microstructure model for teflon-bonded platinum-carbon gas-diffusion electrodes based on the results of EBMA, SEM and light microscopy. It is confirmed that the microstructure is determined both by direct adherence of agglomerates and teflon-fibrils interconnecting these agglomerates. (12 refs.)

120642 Sensitization of polycrystalline $SrTiO_3$ photoanodes by mechanical polishing. B.T.Chang, G.Campet, J.Claverie, P.Hagenmuller (Univ. de Bordeaux I, Talence, France), J.B.Goodenough.
J. Solid State Chem. (USA), vol.49, no.2, p.247-55 (Sept. 1983).
The photoelectrochemical properties of polycrystalline $SrTiO_3$ anodes have been investigated as a function of surface treatment. Mechanical polishing of the undoped samples results in an anomalous visible photoresponse extending to 6000 nm. The polishing effect can be removed by either chemical etching or annealing of the samples. An energy diagram of the polished undoped $SrTiO_3$ electrode and the main mechanism of its visible photoresponse have been proposed. (52 refs.)

120643 The aqueous and non-aqueous electrochemistry of polyacetylene: application in high power density rechargeable batteries. A.G.MacDiarmid (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA), R.B.Kaner, R.J.Mammone, A.J.Heeger.
J. Phys. Colloq. (France), vol.44, no.C-3, p.543-50 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Polyacetylene can be doped either chemically or electrochemically in aqueous solution to the metallic regime. The characteristics of selected rechargeable batteries employing $(CH)_x$ electrodes in non-aqueous electrolytes are described. (2 refs.)

120644 Conductive polymers as electrode materials. M.Armand (Lab. d'Energetique Electrochimique, Domaine Univ., St.-Martin-d'Heres, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.551-7 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Polyacetylene and its related polymers are amphoteric insertion compounds accommodating both cations and anions. This property make them ideal candidates for electrochemical energy storage. However, the electrochemistry of these compounds is not fully clarified and the main remaining problems are evoked. (22 refs.)

120645 Electrochemical oxidation and reduction of polyparaphenylene. F.Maurice, G.Froyer, Y.Pelous (CNET, LAB/ROC/TIC, Lannion, France).
J. Phys. Colloq. (France), vol.44, no.C-3, p.587-90 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The authors have studied the electrochemical oxidation and reduction of polyparaphenylene (PPP) synthesized in powder form from benzene. Although initially insulating, the polymer could be oxidized or reduced very easily due to a good porosity of the material. High discharge currents could be obtained, but with a limited coulombic efficiency. The difference between the onset voltages of oxidation and reduction is about 2.8 V. (8 refs.)

120646 Electrochemical solid-state study of organic conducting materials. M.Lamache (Lab. de Chimie Analytique, Univ. Pierre et Marie Curie, Paris, France), A.Moradpour.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1189-93 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
The anodic oxidation of the following electron donors: TTF, TMTTF, TMTSF, has been studied in the presence of different anions, in order to detect the formation of mixed-valence salts which can be generated during the oxidation of these compounds. Several electrochemical techniques have been used, mainly the carbon paste electrode which allows one to investigate stable intermediate phases which may occur during the redox transformations of organic solids. (11 refs.)

120647 Mass transfer in magnetic fields at vertical electrodes. V.V.Skripachev, Yu.G.Mikhalev, L.A.Isaeva, P.V.Polyakov (M.I. Kalinin Inst. of Nonferrous Metals, Krasnoyarsk, USSR).
Sov. Electrochem. (USA), vol.19, no.1, p.27-32 (Jan. 1983). Translation of: *Elektrokhimiya (USSR),* vol.19, no.1, p.30-5 (Jan. 1983). [received: Sept. 1983]
The method of integral relationships was used to solve the system of differential Navier-Stokes, continuity and convective-diffusion equations for anodic dissolution of a vertical plate in a solution (or melt) which is infinitely dilute with respect to the potential-determining ions and where a homogeneous magnetic field is applied. The solution is written as $Sh=0.75(\beta Sc)^{1/3}Gr^{1/4}$, where β is a parameter that depends on the physicochemical properties of the solution (or melt), the current density, and the magnetic flux density. Results calculated with the equation are in satisfactory agreement with experimental data. (12 refs.)

120648 Discharging and ionization of lead on a germanium electrode. Kh.Z.Brainina, A.V.Kaisin (Sverdlovsk Inst. of the Nat. Economy, Sverdlovsk, USSR).
Sov. Electrochem. (USA), vol.19, no.1, p.78-82 (Jan. 1983). Translation of: *Elektrokhimiya (USSR),* vol.19, no.1, p.87-91 (Jan. 1983). [received: Sept. 1983]
The discharging and ionization of lead on single-crystal germanium electrodes with different types of conduction, as well as the influence of the concentration of lead ions in the solution, the potential for limiting cathodic polarization, and illumination, on the processes just indicated have been investigated by cyclic voltammetry. The results obtained have been attributed to two factors: the presence of the metal in two energy states on the electrode surface and the changes in the kinetics of the electrode process upon illumination of the electrode surface. 82.50 PHOTOCHEMISTRY AND RADIATION CHEMISTRY

(see also 33.50 Fluorescence, phosphorescence; radiationless transitions)

120649 Infrared emissions in the CO_2-laser-induced photolysis of trifluoromethane-*d* and mixtures of trifluoromethane-*d* and -*h*. Y.Ishikawa, S.Arai (Inst. of Phys. & Chem. Res., Saitama, Japan), H.Yamazaki, Y.Hama.
Appl. Phys. B (Germany), vol.B32, no.2, p.85-92 (Oct. 1983).
Time-resolved infrared emission spectra in the wavelength region of 2-5 μm were measured for the CO_2-laser-induced photolysis of trifluoromethane-*d* (CDF_3) and its mixtures with trifluoromethane-*h* (CHF_3). The reactant pressures were 0.1-20 Torr at room temperature; some collisions were expected to occur within the laser-pulse duration. The emissions due to vibrationally excited CDF_3* (C-D stretching mode and probably combination mode) and DF* were observed at the same time for the irradiation of pure CDF_3. DF* should be produced in the unimolecular decomposition of CDF_3*. The dependences of the DF* emission on the experimental condition are explicable on the assumption that the collisional energy transfer followed by the decomposition of CDF_3 plays an important role in the present IRMPD, besides its direct multiple-photon decomposition. The mixture of CDF_3 and CHF_3 showed the emissions due to HF* and CHF_3* in addition to DF* and CDF_3*. The ratio between the DF* and HF* emission intensities, I_{DF}/I_{HF}, was examined as a function of pressure. The pressure dependences were similar to those of the selectivity determined previously from the concentration changes of CDF_3 and CHF_3. The irradiation of mixtures with a long duration pulse (80 ns fwhm with a 2 μs) resulted in a marked decrease in I_{DF}/I_{HF}. (30 refs.)

120650 Time-of-flight mass spectrometry using multiphoton ionization and IR multiple photon dissociation: decomposition of the triethylamine cation. J.S.Chou, D.Sumida, C.Wittig (Univ. of Southern California, Los Angeles, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.209-13 (9 Sept. 1983).
Low-energy, adiabatic dissociation pathways of molecular ions can be determined unambiguously by combining IR multiple photon dissociation with a laser based time of flight mass spectrometer. In this study, the authors report the sequential dissociation mechanism for the triethylamine cation. (23 refs.)

120651 Metal carbonyl bond strengths: applications of photoacoustic calorimetry. M.Bernstein, J.D.Simon, K.S.Peters (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.241-4 (9 Sept. 1983).
Photoacoustic calorimetry has been used to determine the bond dissociation energy of a single carbonyl from the group VI hexacarbonyls in ethanol and cyclohexane. The determined reaction enthalpies are for the photodissociation of a single CO from $Cr(CO)_6$, $Mo(CO)_6$, and $W(CO)_6$ in ethanol and cyclohexane are found to be 37, 34, and 38 kcal/mole, respectively. (19 refs.)

120652 Multiphoton ionization detection of photodissociation fragments: NO from CH_3ONO, C_2H_5ONO, and C_3H_7ONO. G.Radhakrishnan (Chem. Dept., Univ. of Southern California, Los Angeles, CA, USA), R.C.Estler.
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.403-7 (23 Sept. 1983).
The single photon photodissociation of CH_3ONO, C_2H_5ONO, and C_3H_7ONO has been studied under collision-free conditions using multiphoton ionization to detect the NO fragment. NO rotational excitation from CH_3ONO was very large ($E_{rot}>2100$ cm^{-1}) and non-thermal, while C_2H_5ONO and C_3H_7ONO produced NO which could be characterized by $T_{rot}=350$ and 250K respectively. (46 refs.)

120653 $OH(X^2\Pi)$ state distribution from HNO_3 and H_2O_2 photodissociation at 193 nm. A.Jacobs, K.Kleinermanns, H.Kuge, J.Wolfrum (Max Planck Inst. fur Stromungsforschung, Gottingen, Germany).
J. Chem. Phys. (USA), vol.79, no.6, p.3162-3 (15 Sept. 1983).
The authors describe OH rotational, vibrational, and fine structure state distributions obtained from HNO_3 and H_2O_2 photodissociation at 193 nm under collision-free conditions. (13 refs.)

120654 The kinetics of the photolysis of thin films of tin diodide. M.Green, T.A.Kuku (Dept. of Electrical Engng., Imperial Coll. of Sci. & Technol., London, England).
J. Phys. & Chem. Solids (GB), vol.44, no.10, p.999-1008 (1983).
The kinetics of photolysis of thin films of SnI_2 have been followed using a quartz crystal microbalance technique. The products of photolysis are iodine gas generated at the surface and tin formed within the SnI_2 (which appears as α-Sn even up to ~400K). Rate as a function of extent of reaction, film thickness, light intensity and wavelength, temperature, doping agents and substrate and finally thin film microstructure have been investigated for both high and low temperature polymorphic forms of SnI_2. The extent of photolysis, which always starts by being linear in time, goes via an intermediate regime to being proportional to $t^{1/2}$. The kinetics of photolysis are similar to PbI_2 studied previously [by Halbrecht et al. (1977)] and, as for that case, the photolysis mechanism is consistent with a rate determining anion motion. (13 refs.)

120655 Temperature dependence of the carbon dioxide photoabsorption cross section between 1200 and 1970 Å. B.R.Lewis, J.H.Carver (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.297-309 (Oct. 1983).
Photoabsorption cross sections have been measured for carbon dioxide at 0.5 Å intervals between 1200 and 1970 Å. The instrumental resolution was about 0.05 Å and measurements were performed using relatively low pressures at temperatures near 200, 300, and 370K. The room temperature cross sections are found to be in good agreement with previous measurements and a temperature effect is found which is small at the shorter wavelengths, passing through a minimum near 1400 Å. At longer wavelengths the temperature effect increases steadily until at some fixed wavelengths above 1900 A the cross section increases by a factor of about 20 as the temperature is increased from 200 to 370K. This behaviour is of particular significance to calculations

of carbon dioxide photodissociation rates at low altitudes in the Martian atmosphere. (16 refs.)

120656 NO fluorescence during vacuum-ultraviolet photodissociation of $CFCl_2NO$. C.A.F.Johnson (Dept. of Chem., Heriot-Watt Univ., Edinburgh, Scotland).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1355-63 (Sept. 1983).
Gas-phase photodissociation of $CFCl_2NO$ at 147 nm results in the formation of electronically excited NO in the $B\ {}^2\Pi$ state, giving rise to the well known NO β-emission bands. Collisional effects consequent upon the addition of helium lead to the appearance of fluorescence from the $NO(A\ {}^2\Sigma^+)$ state with emission from the $v'=2$ and 3 levels dominating the spectrum. The results are compared with data obtained previously for other nitrosocompounds. (22 refs.)

120657 Photochemistry and sensitized evolution of hydrogen from water using water-soluble cationic porphyrins. Tetrakis(trimethylaminophenyl)porphyrinatozinc and its free base. K.Kalyanasundaram (Inst. de Chimie Phys., Ecole Polytech. Federale, Lausanne, Switzerland).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1365-74 (Sept. 1983).
Photophysical properties (fluroescence spectra, lifetimes, triplet-triplet absorption spectra, triplet lifetimes and quantum yields) and redox potentials have been measured for the free-base, Zn^{2+} derivatives of a cationic water-soluble porphyrin, tetrakis(trimethylaminophenyl)porphyrin [TAPP(4+)]; the values are similar to those of tetrakis(sulphonatophenyl)porphyrin, TPPS(4−). The zinc porphyrin ZnTAPP undergoes facile photoredox reactions and also sensitizes H_2 evolution upon visible-light photolysis in 'sacrificial' systems, albeit with a lower efficiency in comparison with tetrakis(4-methylpyridyl)porphyrin, ZnTMPyP. (19 refs.)

120658 Phosphorence and state of chlorophyll in solutions. K.N.Solov'ev, S.S.Dvornikov, V.N.Knyukshto, A.E.Turkova.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.73-9 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.87-95 (Jan. 1983).
The conditions of previous low-temperature experiments were such that only the solvated long-wave form of the pigments, which is usually stabilized at reduced temperature, was investigated. It seemed necessary to investigate the phosphorescence of a less solvated form of chlorophyll, which is formed at low temperatures under special conditions and does not have an absorption spectrum similar to the absorption spectrum of this pigment at room temperature in nonpolar and weakly polar solvents. The authors present the result of such an investigation; the data obtained are compared with the data for the solvated form. (18 refs.)

120659 Study of relaxation in cross-linked polymer compositions. Yu.I.Rumyantseva, V.M.Anisimov, R.G.Zhbankov, O.N.Karpukhin.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1297-300 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.813-18 (Nov. 1982). [received: Sept. 1983]
The authors have studied the relaxation processes in a cross-linked polymer composition based on cellulose acetophthlate and the dimethacrylate ester of ethylene glycol from the kinetic features of the photooxidation of impurity anthracene. (9 refs.)

120660 Pulse radiolysis conductivity measurements in aqueous solutions with nanosecond time resolution. E.Janata (Radiation Lab., Univ. of Notre Dame, Notre Dame, IN, USA).
Radiat. Phys. & Chem. (GB), vol.19, no.1, p.17-21 (1982). [received: Oct. 1983]
A DC-conductivity apparatus is described which allows high precision time resolved conductometric measurements to be made beginning ~7 ns after a fast electron pulse over a pH range from 3 to 11.5. A time resolution of 1.8 ns has been achieved by using a new type of cell made of glassy carbon and improved detection electronics. A rate constant of $k=1.2\times10^{11}\ M^{-1}\ s^{-1}$ has been determined for the neutralization reaction $H^++OH^- \rightarrow H_2O$ at pH=10.64. (21 refs.)

120661 Scavenger competition in the radiolysis of hydrocarbon systems. G.Foldiak (Inst. of Isotopes, Hungarian Acad. of Sci., Budapest, Hungary).
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.167-8 (1982). [received: Oct. 1983]
The radiation chemical reactions of hydrocarbons have previously been studied in the simultaneous presence of two scavengers to determine certain quantitative relationships. To establish whether this procedure is as simple as presumed the author has studied the radiolysis of cyclohexane containing iodine and/or galvinoxyl (Go). (6 refs.)

120662 State correlation diagrams for the photochemical reactions of organometallics. A.Veillard, A.Dedieu (Lab. de Chimie Quantique, Univ. Louis Pasteur, Strasbourg, France).
Theor. Chim. Acta (Germany), vol.63, no.4, p.339-48 (1983).
State correlation diagrams are proposed for a number of photochemical reactions of organometallics. Spin-orbit coupling is found important to understand the reactivity of these organometallics. (35 refs.)

120663 Investigation of some products of photolysis of aqueous solutions of GMP. N.M.Tsyganenko, L.A.Remizova, N.Ya.Dodonova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.84-7 (Aug. 1983). In Russian.
Dominated formamidopyrimidine ribotide has been identified among the products of vacuum ultraviolet photolysis of 5′G MP besides guanine. The methods of thin layer chromatography, colour reactions, VUV and IR spectroscopy have been used for this purpose. (9 refs.)

120664 Magnetic field effect on the hydrogen abstraction of xanthone from xanthene in SDS micelles. Y.Tanimoto, M.Takashima, M.Itoh (Faculty of Pharmaceutical Sci., Kanazawa Univ., Kanazawa, Japan).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.442-4 (23 Sept. 1983).
The magnetic field effect (<800 G) on the hydrogen abstraction of xanthone from xanthene in SDS aqueous micellar solutions was studied using laser flash photolysis. The rate of triplet-singlet intersystem crossing of the radical pair of xanthone ketyl and 9-xanthenyl formed upon photolysis decreases from $1.4\times10^6\ s^{-1}$ at 0 G to $0.4\times10^6\ s^{-1}$ at 640 G. 82.60 CHEMICAL THERMODYNAMICS

(see also 05.70 Thermodynamics)

120665 Enthalpies of formation of Ag-Si, Au-Si and Ag-Au-Si liquid alloys at 1423K. S.Hassam, M.Gaune-Escard (Lab. de Dynamique et Thermophys. des Fluides, Univ. de Provence, Marseille, France), J.P.Bros.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.9, p.785-92 (Sept. 1983).
The enthalpies of formation of silver-silicon, gold-silicon and silver-gold-silicon were determined at 1423K over a large concentration range; a very high temperature calorimeter was used for these investigations. The author's ternary experimental results were represented correctly with a modified Kohler's relation (1960). (29 refs.)

120666 Equilibrium decomposition pressures of the compounds Cs_2ZrCl_6 and Cs_2HfCl_6 and X-ray identification of Na_2HfCl_6, K_2HfCl_6, and Cs_2HfCl_6. G.J.Kipouros, S.N.Flengas (Dept. of Metall. & Materials Sci., Univ. of Toronto, Toronto, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.9, p.2183-8 (Sept. 1983).
The chemical equilibria representing the reactions $Cs_2ZrCl_{6(s\ or\ 1)}=2CsCl_{(s\ or\ 1)}+ZrCl_{4(vap,P,T)}$ and $Cs_2HfCl_{6(s\ or\ 1)}=2CsCl_{(s\ or\ 1)}+HfCl_{4(vap,P,T)}$ were investigated by direct vapour pressure measurements and thermodynamic data such as free energies and enthalpies of reaction have been calculated. The X-ray powder patterns of the compounds Na_2HfCl_6, K_2HfCl_6, and Cs_2HfCl_6 and also reported. With reference to the separation of Hf from Zr by a recently developed process based on the selective reactivity of $ZrCl_4$ $HfCl_4$ vapours with alkali chlorides, it is shown that the efficiency of alkali chlorides as separating agents increases in the order $CsCl \rightarrow LiCl \rightarrow NaCl \rightarrow KCl$. (19 refs.)

120667 Dissolution enthalpies of NaI in binary mixtures of water with aliphatic alcohols methylcellosolve at 298.15K. Enthalpic pair interaction coefficients of NaI-nonelectrolyte in water solution. H.Piekarski (Dept. of Phys. Chem., Univ. of Lodz, Poland).
Can. J. Chem. (Canada), vol.61, no.9, p.2203-8 (Sept. 1983).
The enthalpy of solution, ΔH_{sol}, of NaI in methanol+water, ethanol+water, *n*-propanol+water, isopropanol+water, and methoxyethanol+water at all compositions and ΔH_{sol} of NaI in *s*-butanol+water and tert-butanol+water from 0 to 5 mol% alcohol was measured. The NaI-nonelectrolyte pair interaction enthalpies were determined and correlated with the functions describing some properties of the nonelectrolyte. A functional group additivity concept, introduced by Savage and Wood (1977) or non-ionic solutes, was applied to the interactions between NaI and nonelectrolytes. (54 refs.)

120668 Thermochemical regularities among lanthanide and actinide oxides. L.R.Morss (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.301-21 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
A systematic treatment of the thermochemical properties of binary and complex oxides of the lanthanides and actinides in terms of other well-characterized species and thermochemical cycles is given. Since the trivalent lanthanides provide a reference series with which the lanthanide and actinide sesquioxides can be compared, the trivalent ion energetics are considered first. Recent interest in monoxides, prompted by high pressure synthesis of lanthanide monoxides and interest in divalent actinide metals and oxides, has led the author to include a treatment of the relative stabilities of monoxides and sesquioxides. The important tetravalent state is viewed from the perspective of the dioxides as well as the perovskites $BaMO_3$. (86 refs.)

120669 Comparison of the solution chemistry of the actinides and lanthanides. G.R.Choppin (Dept. of Chem., Florida State Univ., Tallahassee, FL, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.323-30 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The chemical behavior of the lanthanide and actinide elements in aqueous media is compared for similarities and differences. The stability of oxidation states and the thermodynamic parameters of complexation are evaluated to reflect how the decreased shielding of the 5f orbitals relative to that of the 4f orbitals causes the actinides to have somewhat different properties from those

of the lanthanides. Although the interaction of the cations of both series with complexing ligands can be described satisfactorily by an ionic model, the free-energy and enthalpy values of complexation of the trivalent actinides indicate a slightly greater covalency in bonding than that of the comparable lanthanide complexes. This is seen particularly in the metal-nitrogen-bonded systems. (17 refs.)

82.65 SURFACE PROCESSES

120670 Development of the reverse osmosis technique for water desalters. H.Loffler (VEB Wasseraufbereitungsanlagen Markkleeberg, Markkleeberg, Germany), J.Knebusch, M.Balke.
Chem. Tech. (Germany), vol.35, no.9, p.439-41 (Sept. 1983). In German.
Use of the method of reverse osmosis or of combined reverse osmosis and ion exchange, respectively, for water conditioning should be considered a meaningful supplementation of, rather than competition with, other methods of water treatment. Economic evaluation is, therefore, necessary to determine the economically most favorable technology of conditioning. There is sufficient evidence to show that this method affords major economic advantages for certain applications, it being important to note here that the use of conventional systems of complete softening (using ion exchangers) for salt contents greater than or equal to 20 mval/l is not generally possible for both process-engineering and economic reasons. A cellulose acetate-based winding module has been developed, of which the specifications are comparable to those of modules available on the international market. A suitable system technology has been developed on the basis of the winding module concept. (no refs.)

120671 Study of the porous structure and selective properties of membranes obtained by plasma polymerization in a glow discharge. Yu.I.Dytnerskii, A.A.Dmitriev, B.V.Mchedlishvili, I.L.Potokin (Polytech. Inst., Leningrad, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.1024-8 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1166-9 (Nov.-Dec. 1982). [received: Sept. 1983]
The porous structure of ultrathin membranes obtained by plasma polymerization in a glow discharge has been studied by electron microscopy and mercury porosimetry. The dependence of the geometric parameters of the plasma-deposited membranes and their selective and adsorption properties in the filtration of proteins, lattices, and influenza and rabies viruses on the exposure time of the substrate in the flow discharge has been obtained. The applicability of these membranes to microfiltration separation has been evaluated. (7 refs.)

120672 A combined instrument for the investigation of catalytic reactions by means of gas chromatography, secondary ion and gas phase mass spectrometry, Auger and photoelectron spectroscopy, and ion scattering spectroscopy. O.Ganschow, R.Jede, L.D.An, E.Manske, J.Neelsen, L.Wiedmann, A.Benninghoven (Phys. Inst., Univ. Munster, Munster, Germany).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1491-506 (1983).
A combined instrument has been developed which couples a microreactor operated with technical catalysts with a combined surface analytical instrument. The microreactor is equipped with gas chromatography and gas phase mass spectrometry for continuous control of the reaction parameters. The surface analytical part of the instrument incorporates secondary ion and thermal desorption mass spectroscopy, Auger and photoelectron spectroscopy, and ion backscattering spectroscopy, all of which have been developed to their full versatility and efficiency. The transfer of the catalyst from the reactor to the surface analysis station is performed by a valveless lock within about one minute in a vacuum free of organic contaminations. The whole system can be operated fully under computer control. First applications of this instrument have been devoted to the oxidation of methanol to formaldehyde on silver catalysts. (18 refs.)

120673 Reverse osmosis membrane performance as affected by temperature and pressure. M.C.Dale, M.R.Okos (Dept. of Agricultural Engng., Purdue Univ., West Lafayette, IN, USA).
Ind. & Eng. Chem., Prod. Res. & Dev. (USA), vol.22, no.3, p.452-6 (Sept. 1983).
The flux rates of cellulose acetate reverse osmosis (RO) membranes decrease with time because of membrane compaction. The rate of compaction (and resultant flux decline) increases with increasing temperature and pressure. A model for flux decline due to compaction as a function of time, temperature, and pressure is presented and fitted to experimental data. The ability to predict compaction rates of RO membranes as a function of operating temperature and pressure should allow selection of optimal operating parameters and determination of the useful membrane life, all of which are very important factors in designing RO systems. An example of this sort of economic optimization is given. (13 refs.)

120674 Relation between lattice distortions and catalytic properties of cobalt-chromium spinel solid solutions. O.A.Antropova, A.I.Purtov, I.I.Kalinichenko, L.A.Baikova (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1619-21 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1883-5 (Nov. 1982).
A continuous series of solid substitutional solutions $Co^{II}(Co_x{}^{III}Cr_{2-x}{}^{III})O_4$ ($x=0$-2) and $Cu_y{}^{II}Co_{1-y}{}^{II}(Co_x{}^{III}Cr_{2-x}{}^{III})O_4$ ($0<y<1$, $0<x<2$), obtained by thermal decomposition of codeposited hydroxides of the corresponding metals at 600°C has been studied by X-ray analysis. The magnitudes of the distortions and dimensions of the regions of coherent scattering of X-rays (particle size) in the lattice of the spinel phase have been determined. It has been established that lattice deformations appear at the largest cation inhomogeneity of the composition of the starting codeposited hydroxides. The influence of lattice distortions on the catalytic activity of cobalt-chromium spinel solid solutions in the thermal decomposition of ammonium perchlorate has been demonstrated. (5 refs.)

120675 An electrochemical evidence of the O_2 photodesorption from n-TiO_2 surface. G.S.Popkirov (Central Lab. of Solar Energy & New Energy Sources, Acad. of Sci., Sofia, Bulgaria).
Phys. Status Solidi a (Germany), vol.79, no.1, p.323-6 (Sept. 1983).
Evidence of O_2 photodesorption from a n-TiO_2 surface is presented. The sample potential vs. reference electrode is monitored upon immersion of the sample into an electrolyte. The influence of illumination of the sample before the immersion, on the magnitude of the recorded voltage patterns, obtained upon immersion, is investigated. The results are discussed in terms of oxygen sorption processes and their influence on the n-TiO_2 surface energetics. (8 refs.)

120676 Electroconductivity of heterogeneous membranes MK-40 and MA-40 in 1:1, 1:2, 2:1 electrolyte solutions. M.P.Sidorova, I.Z.Bezhanidze, D.A.Fridikhsberg.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.58-63 (Aug. 1983). In Russian.
Considerable dependence of membrane electroconductivity upon outside solution concentration determined experimentally along with calculations using the three-conductor model make it possible to suppose that electric current passes through the membrane wholly on the resin matrix but through consecutive joints of helium parts of the matrix and interhelium intervals filled with free electrolyte solution. (7 refs.)

82.70 DISPERSE SYSTEMS

(for flow behaviour, see 47.55K)

120677 Kinetic analysis of microemulsions using microprocessor controlled UV/visible-spectrometry. G.Gauglitz (Univ. of Tubingen, Tubingen, Germany).
TRAC Trends Anal. Chem. (Netherlands), vol.2, no.10, p.230-6 (Oct. 1983).
Microprocessor controlled spectrometers greatly extend the possibilities for kinetic analysis of complex thermal or photochemical reactions. as a result, more sophisticated evaluation procedures, such as derivative spectroscopy or dynamic multi-component analysis become possible. (16 refs.)

120678 Structural and mechanical properties of polydisperse suspensions of electrocorundum. A.F.Krivoshchepov, A.P.Tikhonov, L.V.Samuilova (D.I. Mendeleev Chem.-Engng. Inst., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.931-4 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1057-61 (Nov.-Dec. 1982). [received: Sept. 1983]
It has been shown that the formation of periodic colloidal structures (PCS) of different types occurs in ion-stabilized aqueous suspensions of electrocorundum, depending on the concentration, dispersity, and polydispersity of the filler. The existence of PCS_1 and PCS_2 fragments, which influence one another and form PCSs of a higher type, is possible in polydisperse systems. The degree of development of particular PCS fragments determines the rheological behaviour of suspensions in different ranges of shearing stresses. (11 refs.)

120679 Features of structure formation during vibration of aqueous solutions of clays. N.N.Kruglitskii, G.Z.Komskii, P.V.Kolotii (Inst. of Colloid Chem. & the Chem. of Water, Acad. of Sci., Kiev, Ukrainian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.1037-40 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1177-80 (Nov.-Dec. 1982). [received: Sept. 1983]
The concentration dependence of structural-mechanical properties of clays and ceramic masses has been studied for different degrees of structure-destruction by shear deformation and by subjection to vibration. It has been established that the critical concentration for structure-formation in these systems increases regularly as the structure is increasingly destroyed. (9 refs.)

120680 A morphological description of the secondary structure of disperse carbon, synthesized by a polycondensation method. Yu.B.Nekrashevich, E.P.Smirnov, A.T.Denisova (Lensovet Leningrad Technol. Inst., Leningrad, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.1041-3 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1181-2 (Nov.-Dec. 1982). [received: Sept. 1983]
The secondary structure of disperse carbon particles, formed by the polycondensation of chlorohydrocarbons, produced by the interaction of individual hydrocarbons and chlorohydrocarbons, is described. The dependence of the morphology of the product on the conditions of synthesis has been determined

and it has been shown that the type and secondary structure of the disperse carbon are determined mainly by the ratio of the numbers of chlorine, hydrogen, and carbon atoms is the numbers of chlorine, hydrogen, and carbon atoms in the molecules of the initial reagents, and by the length of time the reagents stay in the reaction zone. (6 refs.)

120681 Precise vapour-pressure measurements of the solubilization of benzene by aqueous sodium octylsulphate solutions. E.E.Tucker, S.D.Christian (Dept. of Chem., Univ. of Oklahoma, Norman, OK, USA).
Faraday Symp. Chem. Soc. (GB), no.17, p.11-24 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Accurate vapour-pressure-solubility results have been obtained for aqueous solutions of sodium octylsulphate (SOS) and benzene at 15, 25, 35 and 45°C. Thermodynamic constants are reported for reactions of benzene with SOS monomers and micelles; hydrophobic effects are important in stabilizing the aggregates formed between monomeric benzene and SOS species. The observed non-linearity of degree of solubilization with benzene activity indicates that benzene molecules interact cooperatively within the micelles. A mass-action model, employing a form of the Poisson distribution equations modified to account for cooperativity, provides an excellent fit of all the solubilization data at each temperature. Activity coefficients are reported for benzene in the micellar species, as functions of temperature and micellar composition. (21 refs.)

120682 Comparative determination of the size of disk-shape colloid particles by conventional and electric light scattering. Thai Thanh Suong, S.Stoylov (Inst. of Phys. Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).
Izv. Khim. Bulg. Akad. Nauk. (Bulgaria), vol.15, no.4, p.542-52 (1982). [received: Sept. 1983]
Systematic investigations were carried out for particle size determination of various fractions of Na-bentonite. The average size values are determined by the Zimm-plots, by the disymmetry and by the electric light scattering from the decay curves and the saturation values of the electrooptic effect at complete particle orientation. The results permit the estimation of the applicability of the methods and the influence of some deviations from the Rayleigh-Debye-Gans theory on the range of applicability. (22 refs.)

120683 Study by conductimetry and polarimetry of aqueous solutions of quaternary ammonium bromides derived from L α-methyl benzylamine. R.Coudert (Lab. de Chimie Generale et Minerale, Faculte des Sci., Tours, France), R.R.Durand.
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.537-41 (June 1983). In French.
A series of $d(+)$,$l(-)$ and $dl(\pm)$ N-alkyl, N,N,-dimethyl ammonium bromides proceeding from $d(+)$, $l(-)$ and $dl(\pm)$, α-methyl benzylamine, is prepared. The critical micelle concentration (CMC) is measured at 20°C, using conductimetry ($7 \leq m \leq 12$) for all species, and polarimetry ($4 \leq m \leq 12$) for optically active salts. The conductimetric measurements reveal no significant difference between the CMC of these optically active and racemic surfactants. Polarimetric determinations give the same CMC values for $d(+)$ or $l(-)$ salts, slightly greater than results of conductimetry. (20 refs.)

120684 Direct determination of free energies of colloidal dispersions. S.Maleki, C.S.Hirtzel, R.Rajagopalan (Dept. of Chem. & Environmental Engng., Rensselear Polytech.-Inst., Troy, NY, USA).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.289-93 (12 Sept. 1983).
Helmholtz free energies of electrostatically-stabilized colloidal dispersions of monodispersed spherical particles have been obtained using computer experiments, Boltzmann sampling has been shown to be sufficient for determining free energy differences between two dispersions whose pair-potentials are close to each other. Non-Boltzmann sampling has been used when the pair-potentials differ substantially. These results have been compared with the results based on perturbation theory. The techniques used thus offer a direct method to test the latter. (15 refs.)

82.80 CHEMICAL ANALYSIS AND RELATED PHYSICAL METHODS OF ANALYSIS

120685 Optimization of response of chemiluminescence analyzers. A.A.Mehrabzadeh, R.J.O'Brien, T.M.Hard.
Anal. Chem. (USA), vol.55, no.11, p.1660-5 (Sept. 1983).
The behavior of chemiluminescence analyzers is discussed in terms of the response equations for exponential-dilution and plug-flow reactors. Three operational modes are distinguished in each case, and their characteristics and advantages are treated. The response equations are tested experimentally with the ozone/ethylene chemiluminescent reaction. Application to the popular NO/O_3 analyzer is discussed. (12 refs.)

120686 Determination of total cyanide in thiocyanate-containing wastewaters. N.J.Csikai, A.J.Barnard,Jr. (Res. & Dev., J.T. Baker Chem. Co., Phillipsburg, NJ, USA).
Anal. Chem. (USA), vol.55, no.11, p.1677-82 (Sept. 1983).
At high acidities, thiocyanate reacts with nitrate or other oxidants to produce free cyanide. For thiocyanate-containing wastewaters, a total cyanide procedure is reported based on use of EDTA at pH 4.0, acetate buffered, to disrupt the complexes of cadmium, chromium, copper, iron, nickel, and zinc. Nitrite interference is obviated by adding sulfamic acid to the sample. Sulfides are removed from the sample by initial treatment with cadmium carbonate and, if necessary, from distillates with cadmium nitrate. (27 refs.)

120687 Trace element determination by atomic spectroscopic methods—state of the art. M.L.Parsons, S.Major, A.R.Forster (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.411-18 (Sept.-Oct. 1983).
In the 15-year period between 1966 and 1981, detection limits for atomic spectroscopic methods of analysis have decreased by an average of 3 orders of magnitude. The 1982 state of the art for the atomic techniques in general use is presented and the methods compared using the detection limits as the figure of merit. (59 refs.)

120688 Time-resolved electrothermal atomic absorption spectra. N.J.Miller-Ihli, T.C.O'Haver, J.M.Harnly (Dept. of Chem., Univ. of Maryland, College Park, MD, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.429-32 (Sept.-Oct. 1983).
A wavelength-modulated continuum source atomic absorption spectrometer is used to obtain time-resolved atomic absorption spectra (absorbance vs. wavelength) using an electrothermal atomizer. Absorbance spectra are acquired at a rate of 56 Hz during atomization. The operator may choose any portion of the atomization time period to be examined as well as the number of absorbance profiles to be averaged. This time-resolved spectral information facilitates the positive identification of spectral interferences as well as providing for detailed inspection of both analyte and background absorption signals. Several interferences are examined. (11 refs.)

120689 A critical evaluation of the tangential flow torch microwave-induced plasma detector for gas chromatography. S.R.Goode, B.Chambers, N.P.Buddin (Dept. of Chem., Univ. of South Carolina, Columbia, SC, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.439-43 (Sept.-Oct. 1983).
The tangential-flow torch was evaluated as part of an atomic emission microwave plasma detector for gas chromatography. Emission intensities for the elements carbon, sulfur, and bromine in a variety of organic molecules were studied. Calibration plots showed good linearity, indicating that the chemical matrix has little effect on the relative degree of atomization. (18 refs.)

120690 Quantitative determination of deuterium in laser fusion targets by inverse Raman spectroscopy. G.R.Daigneault, M.D.Morris, R.G.Schneggbenburger (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.443-6 (Sept.-Oct. 1983).
Quantitative measurements of deuterium partial pressures in laser fusion targets are made by inverse Raman spectroscopy. Attenuation of atmospheric nitrogen inverse Raman signals is used for standardization of the system. This technique allows calibration curves to be made with long path gas cells. The measurements are accurate to ±20%. (13 refs.)

120691 Raman microprobe analysis of thin films formed on the surface of silver electrical contacts utilizing the surface-enhanced Raman scattering effect. H.Ishida, A.Ishitani (Phys. Chem. Lab., Toray Res. Center, Otsu, Japan).
Appl. Spectrosc. (USA), vol.37, no.5, p.450-5 (Sept.-Oct. 1983).
The laser Raman microprobe has been used in combination with Auger electron spectroscopy for the investigation of thin films formed on the surface of polycrystalline silver relay contacts to illustrate the analytical application of the surface-enhanced Raman scattering (SERS) phenomenon to the evaluation of industrial materials. Raman scattering of thin carbon layers on Ag evaporated films has also been examined in order to confirm the enhancement effect on the Ag surface. From the observed enhanced Raman scattering, carbon and sulfur compounds such as silver sulfate have been identified in the thin films formed in Ag contacts operated repeatedly under several kinds of controlled gas flows. These results demonstrate the possibility of a wide range of application of the SERS effect as a useful analytical method with a high surface sensitivity. (19 refs.)

120692 Indirect determination of oxidant concentration using resonance Raman spectra of dyes. H.Baranska, A.Labudzinska, J.Mlodecka (Inst. of Industrial Chem., Warsaw, Poland).
Appl. Spectrosc. (USA), vol.37, no.5, p.476-7 (Sept.-Oct. 1983).
In their previous work the authors reported the quantitative analysis of aqueous solutions of indigocarmine for concentrations of 10^{-4} to 10^{-5} M. As a continuation of that work, they attempted the next logical step, the use lof indiglocarmine as a quantitative indicator for the indirect determination of an oxidant in a redox system. In this particular experiment, the indigocarmine solution loses its color when it is oxidized. In this oxidation, the structure of the chromophore group in the molecule changes and analytical bands in the RR spectrum disappear. In the present experiment, they used hydrogen peroxide as the oxidant. (2 refs.)

120693 Online sensors for trace metals based on stripping analysis. J.Wang (New Mexico State Univ., Las Cruces, NM, USA).
Am. Lab. (USA), vol.15, no.7, p.14-22 (July 1983).
Stripping analysis is a sensitive, precise, and economical electroanalytical technique for measuring heavy metals. The three requirements for efficient online monitoring—sensitivity, speed, and stability—are present in stripping analysis flow systems. This report describes the design, characteristics, and applications of various flow systems for stripping analysis. (8 refs.)

120694 Radionuclides—tools for analysis and process control. H.Vogg (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
TRAC Trends Anal. Chem. (Netherlands), vol.2, no.10, p.236-9 (Oct. 1983).
Radionuclide techniques have made major contributions to research and development in analysis and process control. A high degree of specialization is now required for the successful development of further, unique, practical applications. (33 refs.)

120695 Measurements of K_0-values for (n, γ) reactor neutron activation analysis. Zhou Yunlu, Shan Huamin, Zhang Wenhua (Inst. of the Nonferrous Metals, Beijing, China).
He Huaxue Yu Fangshe Huaxue (China), vol.4, no.4, p.216-27 (Nov. 1982). In Chinese. [received: Sept. 1983]
K_0-values of 15 nuclides used in reactor neutron activation analysis were measured with a degree of reproducibility (2-10%). Measurements were carried out at different irradiation conditions ($8 < \Phi_{th}/\Phi_e < 117$) using ^{97}Ru and ^{103}Ru as flux ratio monitor and comparator nuclides at the heavy water reactor of Institute of Atomic Energy. In the measurements of K_0-values, the non-$1/E$ epithermal spectrum, the burn-up of target, the true coincidence

effects of γ-rays in cascade and the measurement geometry were considered and the consequent errors corrected. (12 refs.)

120696 Applications of AES and XPS to characterization of aluminium and its compounds. R.L.Tapping, I.Aitchison, D.G.W.Goad (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
Can. J. Spectrosc. (Canada), vol.28, no.3, p.87-94 (1983).
Chemical shifts and the Auger parameter, plasma energy losses and lineshape analysis are secondary aspects of Auger electron spectroscopy and X-ray photoelectron spectroscopy that may provide useful insights into chemical bonding, alloy composition, and the reliability of some quantitative methods of analysis. These procedures are outlined and discussed with reference to results obtained for some aluminium intermetallics and compounds. (27 refs.)

120697 Status report on ASTM E-42 Committee on surface analysis. P.H.Holloway (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1570-3 (1983).
Recognizing that surface analysis is rapidly becoming very important in a number of industrial installations and processes, a group of scientists within the American Society for Testing and Materials formed a group which was aimed at producing standards and recommended practices for this field. Initially, this activity was conducted as a subcommittee of ASTM E-02 Committee on Emission Spectroscopy but in 1976 the activity was transferred to a new committee within ASTM, E-42 Committee on Surface Analysis. The purpose of this committee is to advance the field of surface analysis (both in quality and breadth) through the development of appropriate standards, standard practices, reference data, reference materials, round robins, symposia, workshops, and publications. The committee currently has approximately 140 members and a wide sphere of influence through cooperating scientists and laboratories both within the United States and around the world. (5 refs.)

120698 Electron microprobe techniques for routine compositional analysis of (Hg,Cd)Te. T.M.Moore (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1651-5 (1983). (Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride, Dallas, TX, USA, 8-10 Feb. 1983).
Specialized data reduction methods have been applied to the quantitative X-ray analysis of (Hg,Cd)Te infrared detector materials in the scanning electron microscope. These methods provide a rapid and reliable characterization tool suitable for routine use in a process control environment. The technique is applicable to the entire composition range and provides submicron spatial resolution for compositional profiling of epitaxial layer cross sections. (14 refs.)

120699 Improved laser technique for high sensitivity atomic absorption spectroscopy in flames. E.A.Whittaker, P.Pokrowsky, W.Zapka, K.Roche, G.C.Bjorklund (IBM Res. Lab., San Jose, CA, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.289-96 (Oct. 1983).
Frequency modulation laser spectroscopy is utilized for high sensitivity detection of trace species aspirated into a flame of the type commonly used for atomic absorption spectroscopy (AAS). The method is applied to the detection of sodium atoms in an air-acetylene flame and data are obtained on the distribution of ground and excited state populations as a function of height above the burner. Absorptions as small as 1.5×10^{-4} may be detected with a signal-to-noise of one. With multi-passing, a detection limit of 3.3×10^6 sodium atoms/cm^3 was obtained. (20 refs.)

120700 Current mode operation: a technique for improving the reliability of zirconia oxygen probes in reducing atmospheres. W.E.Borbidge, P.T.Whelan (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia).
J. Appl. Electrochem. (GB), vol.13, no.4, p.519-29 (July 1983).
A technique is described whereby zirconia oxygen sensors with platinum electrodes can be protected from deterioration in reducing atmospheres, typical of metallurgical heat treatment conditions. By the application of current to the sensor, the technique provides a form of anodic protection, while at the same time the oxygen concentration in an atmosphere varying in temperature and composition can be continuously detected and measured. (14 refs.)

120701 Use of infrared spectroscopy to identify crystalline aluminium hydroxides of the $Al(OH)_3-Fe(OH)_3$ system. E.Wolska, W.Szajda (Lab. of Magnetochem., Adam Mickiewicz Univ., Poznan, Poland).
J. Appl. Spectrosc. (USA), vol.38, no.1, p.137-40 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.160-4 (Jan. 1983).
The authors present an example of the use of absorption spectroscopy to identify crystalline aluminium hydroxides in a system also containing hydrated iron oxide. Spectroscopic identification of the coprecipitated products is based on an analysis of the absorption bands due to vibrations of OH groups in the ranges of bending and stretching vibrations. (14 refs.)

120702 Measurement of impurities in a multi-doped sample of cadmium mercury telluride. J.B.Clegg (Philips Res. Labs., Redhill, England), J.B.Mullin, K.J.Timmins, G.W.Blackmore, G.L.Everett, R.Snook.
J. Electron. Mater. (USA), vol.12, no.5, p.879-89 (Sept. 1983).
A comparative analytical study has been carried out on a specially doped specimen of cadmium mercury telluride using different analytical techniques in order to calibrate solid source mass spectrographic (SSMS) analyses. It has been shown that the conventional techniques for standardisation of SSMS that assumes that the ionisation, transmission and collection efficiency of all elements are equal is incorrect with this matrix and can significantly overestimate the impurity concentration. Enhancement factors for a range of elements have been determined which permit quantitative analyses to be made. (10 refs.)

120703 The chemical structure of conducting polyheterocyclic films: XPS studies. P.Pfluger, G.B.Street (IBM Res. Lab., San Jose, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.609-14 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
X-ray photoemission spectroscopy is used to characterize conducting pyrrole and thiophene polymer films. The results are essentially in agreement with α-α' linking of the aromatic rings, but very significant degrees of disorder may occur. Not always is the anion dissolved in the electrolyte for the preparation or for electrochemical cycling of the films found as such in the conducting polymer. Only in the very early stage of oxidation does the doping of neutral polypyrrole proceed by homogeneous charge extraction from the polymeric pyrrole subsystem. At higher doping levels, the N atom of the pyrrole ring provides a reactive site for dehydrogenation and oxygenation reactions. (15 refs.)

120704 A microcomputer-based injection system for investigating the influence of atmospheric pressure on chromatographic response in the analysis of gases. B.R.Wybrow (Res. & Dev. Div., London Res. Station, British Gas Corp., London, England), E.J.Greenhow.
J. Autom. Chem. (GB), vol.5, no.3, p.124-35 (July-Sept. 1983).
In gas chromatographic analysis, in order to assist automation and to improve precision, gas samples are usually injected by means of a gas-sampling valve which is connected to a sample loop of fixed volume. (5 refs.)

120705 Use of pattern-recognition display techniques to visualize the data contained in complex data-bases. A case study. M.P.Derde, D.L.Massart (Farmaceutisch Inst., Vrije Univ. Brussel, Brussels, Belgium), W.Ooghe, A.De Waele.
J. Autom. Chem. (GB), vol.5, no.3, p.136-45 (July-Sept. 1983).
The purpose of the article is to show that pattern-recognition methods can be used to visualize the data and therefore to gain insight into them. These methods are called display methods. This is demonstrated with a practical example: the authentification of the geographical origin of wine. Applications in, for example, archeometry, meteorites, microbiology and medical diagnosis are also feasible. Pattern recognition is a natural addition to automated analysis: eventually there will be instruments which can analyse samples, determine the patten to which a sample corresponds, and suggest its geographical origin. (22 refs.)

120706 Identification of vulcanized mixtures of rubbers by the IR-absorption spectrophotometry. B.Antczak, B.Krajewska (Inst. Przemyslu Gumowego Stomil, Piastow, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.28, no.4, p.132-4 (April 1983). In Polish. [received: Oct. 1983]
Identification is based on a comparison between the intensity of the characteristic absorption bands of the individual polymers and the intensity of 1450-1470 cm^{-1} band present in all the polymers under study. The possibility of detection depends both on the content of the individual rubber components and on the intensity of characteristic absorption bands. (5 refs.)

120707 Standard function and analysis errors in spectrochemical analysis. II. Weighted regression with variable precision of measurement. H.Bubert, R.Klockenkamper (Inst. fur Spektrochem. & Angewandte Spektroskopie, Dortmund, Germany).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1087-98 (1983). In German.
For pt.I see ibid., vol.378, no.2, p.127 (1982). Calibration is a basic operation generally required for spectrochemical analyses. It provides the calibration function through which, by means of mathematical inversion, the analytical function is indirectly accessible. The general case is investigated in which the precision of measurement is not constant but depends on the measuring quantity; it is frequently described by $s_0(I)=(\beta_0{}^2+\beta_1{}^2 I+\beta_2{}^2 I^2)^{1/2}$. By means of a so-called noise analysis the β-coefficients have then to be established and calibration functions must be determined by a weighted regression with factor $1/s_0{}^2$. Admissible are simple, also non-linear functions with few coefficients only, which are calculated so that the least possible errors can be expected in the full measuring range. If 'well-fitting' functions are selected, these errors are proportional to $s_0(I)$ and not essentially higher. The weighting is demonstrated with two examples of spectrochemical analyses: the determination of La in aqueous solutions by ICP-AES and the determination of Zn in brass by XRF. Additionally, it is shown that the 'logarithmic' and the 'relative' regression are in principle similar and actually represent a weighted regression; they are applicable only, however, if the relative precision of the measurements is constant. (12 refs.)

120708 Properties of the cadmium determination with the platform furnace and Zeeman background correction. W.Slavin, D.C.Manning, G.Carnrick, E.Pruszkowska (Perkin-Elmer Corp., Norwalk, CT, USA).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1157-70 (1983).
Cadmium is easy to determine with the combination of the stabilized temperature platform furnace, appropriate matrix modification and Zeeman background correction. The optimized conditions were suitable for many matrices; seawater and urine were explored in some depth. Natural water samples were analyzed for Cd. The matrix modifier included ammonium phosphate and either $Mg(NO_3)_2$ or NaCl. Simple working curves were used. Problems associated with char losses were studied and recovery experiments were shown to expose such problems. The concept of characteristic amount, the mass of analyte that produced a 1% absorption signal (0.0044 abs), especially using integrated absorbance data, was shown to be a very powerful diagnostic tool for graphite furnace work. The characteristic amount for Cd was 0.35 pg/0.0044 abs-s, and it varied little with variations in experimental conditions. The effect of background signals that were evolved rapidly was to disrupt the Zeeman signal. Guidance is provided in identifying and controlling these problems. The advantage of the Zeeman technique in providing improved detection limits using bright sources was explored. (78 refs.)

120709 Determination of nonvolatile components of complex mixtures by headspace analysis. B.V.Ioffe, V.V.Larionov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.112-14 (Aug. 1983). In Russian.
The possibility of accurate determination of nonvolative components and complete analysis of mixtures by combining headspace gas chromatography and refractive index of liquid phase data are illustrated using the example of the ternary system urea-isopropyl alcohol-water. (3 refs.)

120710 New concepts in the state-of-the-art of pH measuring equipment. S.Lichtenstein (Orion Research Inc., Cambridge, MA, USA).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.461-71
Two products have been introduced that significantly improve the performance characteristics, precision, and accuracy of a pH measuring system. A new pH meter uses a technique called 'log R compensation' to produce temperature-corrected pH values without the need for a separate temperature compensator. A new pH electrode, named the Ross electrode, has a unique internal element/solution system that eliminates thermal hysteresis associated with conventional calomel or silver/silver chloride (Ag/AgCl) electrodes. 82.90 OTHER TOPICS IN PHYSICAL CHEMISTRY

120711 A correlation of solvated electron absorption spectra with the solvent parameter $E_T(30)$. H.D.Burrows (Chem. Dept., Univ. of Ife, Ile-Ife, Nigeria).
Radiat. Phys. & Chem. (GB), vol.19, no.2, p.151-4 (1982). [received: Oct. 1983]
A linear correlation is observed between the energy of solvated electron absorption maxima and the values of the empirical solvent parameter $E_T(30)$ for 24 of the 29 solvent systems on which data is available. The correlation spans a wider range of solvent polarity than similar correlations with iodide ion absorption spectra. Of the five solvents which do not give a good correlation, three are amides, and it is suggested that reported solvated electron spectra in these cases may, instead, be due to radical anion absorptions. (32 refs.)

86.00 ENERGY RESEARCH AND ENVIRONMENTAL SCIENCE

86.10 ENERGY RESOURCES AND THEIR UTILISATION

(inc. economic aspects; for nuclear engineering and nuclear power studies, see 28.00)

120712 Occupational risks of energy production. L.A.Cox, J.Fiksel, A.S.Kalelkar (Arthur D. Little Inc., Cambridge, MA, USA), P.F.Ricci.
Nucl. Saf. (USA), vol.24, no.4, p.459-70 (July-Aug. 1983).
A number of technical and methodological issues in the application of process analysis to occupational health risk assessment are discussed, and an illustrative case study is presented. The case study estimates the occupational risks associated with several specific energy technologies that are likely to be used in the next two decades. The nominal plants selected and their supporting fuel cycles range from conventional fossil fuel plants to a solar thermal power plant. Several major sources of uncertainty in the risk assessment are indicated, and a method is provided for dealing with this uncertainty when interpreting risk estimates. (14 refs.)

120713 Finland's energy supply and domestic energy. E.Vaara (Kauppaja Teollisuusmin., Energiaosasto, Helsinki, Finland).
Saehkoe Electr. & Electron. (Finland), vol.56, no.9, p.22-6 (Sept. 1983). In Finnish.
No major changes in Finland's energy supply are foreseeable in the near future. The consumption of coal will increase considerably in the next few years with the rise in the consumption of electricity. The future potential and competitiveness of Finnish industry and the national economy will be major considerations in deciding on large new power stations. (no refs.)

120714 Mobilization of renewable energies for development. R.Gicquel, Y.Lambert.
Rev. Energ. (France), vol.34, no.356, p.505-15 (Aug.-Sept. 1983). In English, French.
Shows that renewable energies are potential constituents and an appreciable complement to classic energy forms, particularly in the agricultural and rural sector. Also reviews their various applications, and then examines ways in which it would be possible to mobilize these energies at an increasing rate in the developing countries. (no refs.)

120715 EFOM 12C case studies. Candidate technologies in the European energy systems: United Kingdom case study. S.C.Littlechild, J.L.Morris, K.G.Vaidya.
Report EUR 8459 EN, Comm. European Communities, Luxembourg (1983), 40 pp. Contract EM2-068-UK(H).
The EFOM 12c model is used to assess the potential contribution of some new energy technologies. Cost and demand assumptions are reviewed and constraints on nuclear electricity capacity and assumptions on demand for energy and industrial output are modified to reflect recent revisions of energy projections. Choice of new technologies included in the model is based on an ETSU assessment. The technologies included are conservation, synthetic natural gas, synthetic natural oil, solar, FBR, pressurised fluidised bed combustion, wave and wind power and combined heat and power. (6 refs.)

86.10B Fossil and other fuels

Five year testing with the Texaco coal gasification plant in Oberhausen-Holten (BRD) ....See Entry 120768

86.10D Wind energy

120716 A theoretical model for estimating the capacity credit of wind power in the presence of correlation between wind speed and electricity demand. J.Carlin (Div. of Maths. & Statistics, CSIRO, Canberra, Australia).
Sol. Energy (USA), vol.31, no.5, p.511-15 (1983).
Haslett and Diesendorf have employed analytic models allowing a qualitative investigation of the variation of capacity credit with a wide range of grid, aerogenerator and load parameters. This note extends their work by describing a model which is capable of representing the joint variation of load and wind and hence does not require the assumption that these two variables are uncorrelated. This assumption has invariably been made in previous work, although there is general recognition that some correlation often exists (generally positive due to common diurnal or seasonal cycles in the two variables). Under the model introduced, estimates of capacity credit may be obtained by numerical calculation. Results are presented. Simple analytic expressions are not in general available for the integrals involved, but some simplifications are made for the special cases of unit and zero correlation, and small and large penetrations. These parallel and extend the results of Haslett and Diesendorf. (10 refs.)

86.10F Tidal and flow energy

(inc. water-wave energy)

120717 On the optimization of the operation of tidal power plants; application of the back-and-forth shooting method. P.J.Orava, T.J.Eirola.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.152-8 (1983).
A simple mathematical model is used for describing the operation of a hydro-electric tidal power plant with a single basin and with bi-directional bulb turbines capable also for the pump modes. The plant of La Rance at the Gulf of St. Malo, France, is used as a typical reference case, where the tide is of the lunar semidiurnal type, as in general at the coasts of the northern Atlantic. The optimization of the dynamic operation is studied via the Pontryagin's maximum principle and thereby the two-point boundary-value problem (TPBVP). The so-called back-and-forth shooting method is used in the computational solution of the TPBVP. Some preliminary results are presented and discussed, as well as further plans for research are sketched. (18 refs.)

86.10H Geothermal energy

120718 Direct use geothermal PON and PRDA projects under DOE-ID administration annual report FY 1982. F.W.Childs, R.D.Sanders (EG&G Idaho Inc., Idaho Falls, ID, USA).
Geothermal Energy (USA), vol.11, no.3, p.11-14 (March 1983).
This report presents the status of geothermal PRDA and PON projects administered by the DOE-ID as of the end of FY-1982. Both programs were instituted to assist the development of the direct application of geothermal energy. The PRDA Program consists of a series of studies designed to investigate the engineering and economic feasibility of geothermal direct applications. The PON Program consists of demonstration projects in which project costs are shared between DOE and the private companies, municipalities, or organizations. During this reporting period, fiscal year 1982, EG&G Idaho provided program management and technical support for 12 demonstration projects and five engineering and economic studies. Each project is summarized. (no refs.)

86.10K Solar energy

120719 Optimal water cost from solar-powered multieffect distillation. B.W.Tleimat (Water Thermal & Chem. Technol. Center, Univ. of California, Berkeley, CA, USA).
Desalination (Netherlands), vol.44, p.153-65 (May 1983).
Presents a short review of solar distillation followed by a description of conventional distillation methods and associated energy consumption. The paper then presents a system where solar energy is used to generate steam to drive a multieffect distillation plant. The system is optimized on the basis of minimum water cost. The analysis shows that enhancement of heat-transfer coefficients in the distillation section and increasing steam temperature from solar boiler result in lower water cost as well as increase the output per unit area of solar collectors. This study shows that a solar boiler producing saturated steam at 60°C in combination with an evaporator-condenser, developed and tested at the authors laboratory, resulted in minimum water costs ranging from \$1.40 to \$3.70 per m^3 for brackish water feed and \$2.15 to \$4.70 per m^3 for seawater feed. At these conditions, the daily productivity per unit area of solar collectors ranged from 45 to 130 liters per m^2. This study also shows that when the steam temperature was increased from 60°C to 88°C, the minimum water cost decreased from \$2.15/m^3 to \$1.37/m^3 for brackish water feed and from \$3.60/m^3 to \$2.05/m^3 for seawater feed. Also, at these conditions, the daily productivity per unit area of solar collector increased to 288 l/m^2 for brackish water feed and to 151 l/m^2 for seawater feed. These predicted values for the daily productivity of simple solar stills at the assumed value of solar insolation. (8 refs.)

120720 Solar energy: prospects for Austria.
Elektron Int. (Austria), no.7-8, p.197 (1983). In German.
A brief account is given of the research and development programmes in Austria on direct utilization of solar energy by means of heat exchangers, heat pumps and photovoltaic solar cells. The work is supported by Shell Austria, ASSA (the Austrian solar energy and space research association) and the Ludwig Boltzmann Solid State Physics Institute. (no refs.) *S.R.*

120721 Dish concentrators for solar thermal energy. L.D.Jaffe (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Energy (USA), vol.7, no.4, p.304-12 (July-Aug. 1983).
A wide variety of point-focusing concentrators are under consideration for solar thermal energy use. They are briefly reviewed. This paper surveys the design and development of dish concentrators and discusses briefly the cost and performance needed. Overall system and site design and such subsystems as receiver, engine, generator, and controls are touched on only as they impact concentrator characteristics. (9 refs.)

120722 Economic feasibility of retrofit solar hot water systems. R.R.Somers, M.R.Sexton (Univ. of Virginia, Charlottesville, VA, USA), A.C.Pritchard, M.C.Hoffman, L.S.Fletcher.
J. Energy (USA), vol.7, no.4, p.325-31 (July-Aug. 1983).
This paper presents the results of an economic feasibility study of 177 public buildings (schools, hospitals, local government buildings, and public care facilities) in the Commonwealth of Virginia to determine if active flat-plate solar collector systems could economically augment or replace existing hot water heating installations. Utilizing the F-CHART method and life-cycle costing techniques, two collector areas were determined for each facility: the optimum collector area (where the present worth of the lifetime net savings was maximized) and the maximum collector area (where the amount of solar energy that could be utilized without losing money was maximized). Solar systems that would pay for themselves within 25 years could be installed in 77 of the 177 buildings (43.5%), with a mean discounted payback period of 17.7 yr. These units would provide 78.8% of the facilities' hot water loads. The study also reveals that for a given fuel cost, the collector areas of these systems are directly proportional to the total hot water loads. In addition, the shortest discounted payback period of an optimally designed solar system may be obtained directly from the fuel cost. These relationships could lead to simplified sizing techniques for active solar hot water system retrofits. (14 refs.)

120723 Solar thermal technologies: potential benefits to US utilities and industry. K.L.Terasawa, W.R.Gates (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Energy (USA), vol.7, no.4, p.361-6 (July-Aug. 1983).
Solar thermal technologies (STT) represent an important element of solar energy research efforts. STT provides a renewable and environmentally attractive source of thermal and electrical power, which can be utilized in a broad range of applications servicing a variety of economic sectors. STT complements nuclear and coal technologies as a means of reducing US dependence on imported petroleum. The net present value of the energy cost savings attributable to STT in electric utility and industrial process heat applications is estimated for alternative future energy cost scenarios and alternative production cost for solar thermal technology. Under reasonable assumptions regarding future fuel prices and STT production cost, the expected benefits of developing an STT option are significant. Despite these benefits, private investment in STT reserarch and development is unlikely, due to the high level of uncertainty characterizing both future energy prices and the expected returns from such research. Federal participation is required if cost-competitive STT systems are to be available during this century. (10 refs.)

120724 Economic possibilities of installation of solar plants for heating water. A.A. Arata (Univ. Tecnica Federico Santa Maria, Valparaiso, Chile).
Scientia (Chile), vol.46, no.156-157, p.72-9 (Jan.-Dec. 1981). In Spanish. [received: Sept. 1983]
Presents at a level of preinvestment study, the economic possibility of installation of solar plants for heating water in the Northern and Central zone of Chile. The analysis considers the incidence of the increase of energy costs in order to obtain the economic indicator per zone. (4 refs.)

120725 Solar geometry for fixed and tracking surfaces. J.E.Braun, J.C.Mitchell (Solar Energy Lab., Univ. of Wisconsin, Madison, WI, USA).
Sol. Energy (USA), vol.31, no.5, p.439-44 (1983).
A general expression for the solar radiation incidence angle in terms of the slope and surface azimuth is derived for both fixed and tracking surfaces. Using this expression, relationships for the slope and azimuth of optimally tracked one- and two-axis tracking surfaces are developed. This information is necessary in determining incident solar radiation based upon horizontal measurements. (7 refs.)

120726 The utilizability function. I. Theoretical development of a new approach. J.M.Gordon, Y.Zarmi (Jacob Blaustein Inst. for Desert Res., Ben-Gurion Univ. of the Negev, Sede Boger, Israel).
Sol. Energy (USA), vol.31, no.6, p.529-36 (1983).
A new theoretical approach to the calculation of the utilizability function is developed and applied to the case of the annual performance of solar collectors of high concentration ratio. The utilizability is calculated in mathematical closed form as an integral over the contributions of the daylight hours of one representative day, equinox. The daily variations in the instantaneous solar radiation are represented by random fluctuations superimposed on the clear day radiation pattern. The results are compared with detailed meteorological data. A simple and practical analytic expression for the utilizability is derived for the limiting case of clear climates, and provides accurate predictions for the utilizability for all climates. The presentation is in two parts: the current paper details the theory and derivation, and the following paper gives solved examples and practical comparisons. (11 refs.)

120727 Estimates of irradiance over Zimbabwe. G.Lewis (Faculty of Engng., Univ. of Zimbabwe, Harare, Zimbabwe).
Sol. Energy (USA), vol.31, no.6, p.609-12 (1983).
The irradiance incident on a horizontal surface in a given location can be estimated from commonly-observed and/or easily obtained meteorological and geographical parameters. This technique is of interest to less developed countries where solar radiation measuring instruments are scarce. This report gives the results of a regression analysis of measured monthly mean values of daily irradiance, daily sunshine hours duration and daily relative humidity. From these results estimates of irradiance over selected locations in Zimbabwe were obtained. (11 refs.)

86.10N Nuclear energy

120728 Role of nuclear power in Pakistan. M.Ahmad (Chashma Nuclear Power Project, Islamabad, Pakistan).
Nucleus (Pakistan), vol.20, no.1, p.3-10 (Jan.-March 1983). [received: Oct. 1983]
The paper reviews the energy demand and supply position in Pakistan and stresses the need for tapping nuclear energy in view of the limitations of conventional energy resources. It is shown that even under conditions of modest economic growth and with the maximum exploitation of available hydro and other resources, the country would still be compelled to install a large block of nuclear generating capacity over a period of next two decades to meet its power needs. A cost-comparison between nuclear and coal/oil-fired units brings out a decided tilt in favour of nuclear plants which has led the government to decide on the construction of the country's second nuclear plant at Chashma scheduled for completion by 1989. (no refs.)

(for superionic conductors, see 66.30H)

120729 Decomposition of β-alumina in an oxygen potential gradient. K.T.Jacob (Dept. of Metall. & Materials Sci., Univ. of Toronto, Toronto, Canada).
J. Appl. Electrochem. (GB), vol.13, no.4, p.469-72 (July 1983).
Single phase sodium β-alumina solid electrolyte was found to undergo isothermal phase separation in electrochemical cells, where a large oxygen potential gradient was imposed across the electrolyte and electrodes, not reversible to sodium ions, were short circuited. The experimental conditions and evidence of decomposition are outlined and a thermodynamic explanation for the phenomenon is given. This finding may lead to new methods for making multilayered ceramic materials involving ionic conductors. (2 refs.)

86.30F Secondary cells

120730 The technology of the Li/Cl_2 in SO_2Cl_2 cell system. IV. High temperature performance, storability, and safety characteristics. R.M.Murphy, C.C.Liang (Electrochem Industries Inc., Clarence, New York, NY, USA).

J. Appl. Electrochem. (GB), vol.13, no.4, p.439-49 (July 1983).

Tests were conducted to determine the performance, storability, and safety characteristics for specially designed Li/Cl_2 in SO_2Cl_2 (Li/CSC) cells at temperatures as high as 150°C. Discharge tests at 150°C showed that practical Li/CSC D cells yield energy densities of 0.75 to 0.91 Wh cm^{-3} for constant resistive loads of 3.0 to 75.0 ohms, respectively. Further, the performance results obtained for cells stored at 150°C and either discharged at 25°C or discharged at 150°C showed little loss in realised capacity but exhibited a noted loss in rate capability. These cells have been subjected to abusive conditions such as short circuit, forced overdischarge, incineration, puncture, and shock sensitivity testing following prolonged discharge at both ambient and elevated temperatures. Safety/hazard testing has also included specific combinations of the above abusive conditions. The results relative to the safe, efficient use of the cells at elevated as well as room temperatures will be discussed. (11 refs.)

120731 The technology of the Li/BrCl in $SOCl_2$ inorganic battery system: performance and self-discharge characteristics following long-term storage. P.W.Krehl, C.C.Liang (Electrochem Industries Inc., Clarence, NY, USA).

J. Appl. Electrochem. (GB), vol.13, no.4, p.451-8 (July 1983).

Investigations were conducted on Li/BrCl in $SOCl_2$ cells to determine both the performance and shelf life characteristics after storage for a period of one year at various temperatures. Room temperature discharge test results indicate that there is little self-discharge in those cells stored at either room temperature or at −40°C. Even when the cells were subjected to elevated storage temperatures, the discharge results show that the cells exhibit a low self-discharge rate. However, cells stored at an elevated temperature do exhibit a decreased rate capability when compared to those results obtained from fresh cells. From the 56 ohm load discharge performance results, the self-discharge rate for cells stored at −40, 24, 50 and 72°C was calculated. Further, the activation energy over the temperature range was found to be 27.6 ± 1.7 kJ. Also, the self-discharge rate was monitored under light load conditions. The results for Li/BrCl in $SOCl_2$ D cells discharged under a current density of 2.38 to 0.016 mA cm^{-2} show that the operationally induced self-discharge rate reaches a maximum of 4.5 μA cm^{-2} for cells discharged under a current density of 0.034 mA cm^{-2} and decreases to 2.9 μA cm^{-2} as the discharge current density decreases to 0.016 mA cm^{-2}. These data indicate that the self-discharge rate for cells discharged under very light loads may eventually approach that for cells stored under open circuit conditions. (2 refs.)

120732 Electrochemical cells employing polyacetylene and poly(p-phenylene) as active materials. L.W.Shacklette, R.L.Elsenbaumer, R.H.Baughman (Corporate Res. Center, Allied Corp., Morristown, NJ, USA).

J. Phys. Colloq. (France), vol.44, no.C-3, p.559-65 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

The electrochemical behavior of polyacetylene and poly(p-phenylene) is discussed in terms of band-structure and crystal structure. (9 refs.)

120733 Solid state batteries with conducting polymers. F.Beniere, D.Boils, H.Canepa, J.Franco, A.Le Corre, J.P.Louboutin (Sci. des Materiaux, Univ. de Rennes I, Rennes, France).

J. Phys. Colloq. (France), vol.44, no.C-3, p.567-72 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

The conducting polymers like $(CH)_x$ are very interesting materials for electrodes in electrochemical cells. The authors have combined such electrodes with solid electrolytes to build 'all solid-state' batteries. The first prototypes using a silver anode and a silver conducting electrolyte have been working satisfactorily for two years. The performances have been tested with many batteries to study the electrical properties as well as the thermodynamical parameters. A number of cycles of charge-discharge have been recorded at various values of the current kept constant. This has allowed them to determine the essential properties: voltage, current, current density, reliability, Faradaic and energetic efficiency... The performances have also been investigated as a function of temperature, allowing them to derive the enthalpy and the entropy of the electrochemical reaction. The kinetics of the discharge has been thorough—fully measured and compared to mass transport data recently obtained by using radiotracers. This has given a clear explanation of the mechanism of mass transport inside the polymer. (15 refs.)

120734 Lightweight, stable, and rechargeable battery and capacitor with activated carbon fiber electrode. T.Nogami, H.Mikawa, M.Nawa (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).

J. Phys. Colloq. (France), vol.44, no.C-3, p.573-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

The authors have made a rechargeable battery and an electric double layer capacitor by use of an activated carbon fibre as the electrode material. (10 refs.)

120735 $(CH)_x$ as an electrode material: some properties during the electrochemical process. P.Bernier (Groupe de Dynamique des Phases Condensees, Univ. de Sci. et Tech. du Languedoc, Montepellier, France), A.El-Khodary, F.Maurice, C.Fabre, P.Mirebeau, A.M.Ledunois.

J. Phys. Colloq. (France), vol.44, no.C-3, p.583-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

The authors have studied the behaviour of p-type doped $(CH)_x$ electrodes in rechargeable batteries $(CH)_x$/1M $LiClO_4$ in PC/Li. They have measured the cell voltage under constant current, the coulombic efficiency versus the charge state and estimated the importance of side reactions. Furthermore they have deduced the ClO_4^- diffusion coefficient in the solid material and evaluated the limit number of charge-discharge cycles with an amplitude of 0.07 electrons per CH unit. 120736 Maximum power consideration in lossy solar cells. B.Prasad (Dept. of Phys., Univ. of Roorkee, Roorkee, India), K.Gopal, N.M.Ravindra, S.Robin.

Int. J. Electron. (GB), vol.55, no.4, p.681-4 (Oct. 1983).

A simple technique is presented which eases the requirements for maximum power consideration in solar cells with resistive losses. This technique is based on the well known general condition for maximum power $dP=(\partial P/\partial I)\, dI+(\partial P/\partial V)\, dV=0$. The present analysis is made for a real solar cell, one with both series and shunt resistances present simultaneously. (2 refs.)

120737 A method for the measurement of solar cell series resistance. V.N.Singh, R.P.Singh (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).

J. Phys. D (GB), vol.16, no.10, p.1823-5 (14 Oct. 1983).

A simple method is suggested for measuring the series resistance of a solar cell which utilises only a single I-V curve at a moderate light intensity level. (6 refs.)

120738 Review of conductor-polymeric semiconductor solar cells. J.Kanicki (Chimie Organique Phys., Univ. Libre de Bruxelles, Bruxelles, Belgium).

J. Phys. Colloq. (France), vol.44, no.C-3, p.529-35 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).

The photovoltaic properties of Schottky barrier, heterojunction and photoelectrochemical cells involving organic polymers are reviewed. (13 refs.)

120739 Operational experience with flat plate photovoltaic systems. V.V.Risser, P.Hutchinson, S.Durand (New Mexico Solar Energy Inst., Las Cruces, NM, USA).

J. Energy (USA), vol.7, no.4, p.332-7 (July-Aug. 1983).

In 1977-8 the US Department of Energy initiated a program to obtain experience in the operation and maintenance of intermediate-sized photovoltaic systems. After evaluation of competitive proposals, four flat-plate and five concentrator-type photovoltaic systems were selected for construction. This paper describes the first-year operational results of two of the flat-plate systems, both located in the semiarid climate of the southwestern United States. The 20 kW system in El Paso, Texas, has been operating since January 1981. The 100 kW system in Lovington, New Mexico, has been operating since March 1981. A complete project record is maintained by using an extensive instrumentation system that records performance data and weather information at each site. This information is augmented by recording all required maintenance activity on the system. The New Mexico Solar Energy Institute is monitoring performance and assisting with maintenance on both systems. Performance to date is encouraging for those interested in this alternate energy technology. It clearly shows that successful operation of large-scale flat-plate systems is achievable today. (no refs.)

120740 A simple solar cell series resistance measurement method. J.Cabestany, L.Castaner (ETSI Telecommunicacion, Barcelona, Spain).

Rev. Phys. Appl. (France), vol.18, no.9, p.565-7 (Sept. 1983).

A new and simple technique to evaluate the series resistance of a solar cell is described. This procedure only needs dark I(V) measurements and a simple experimental-arrangement including a calibrated standard resistor. Comparison with other commonly used methods is also discussed. (4 refs.)

120741 Photovoltaic cells illuminated in spectra splitting. I. Comparative study of the $Ga_{1-x}Al_xAs$-Si and GaAs-Ge coupled solar cells under concentrated light. A.Chave, J.R.Leguerre (Lab. d'Energie Solaire, Faculte des Sci., Rabat, Morocco).

Rev. Phys. Appl. (France), vol.18, no.9, p.569-86 (Sept. 1983). In French.

Presents a study of the photovoltaic behaviour of a set two systems each of which has two solar cells $Ga_{1-x}Al_xAs$-Si and GaAs-Ge coupled with a dichroic mirror in sunlight. The model of each system shows the influence of physical and technological parameters on the photocurrents and efficiency of the cells. The analysis is performed under concentrated light taking into account the losses due to series resistance, shadowing ratio and temperature effect. The minimization of losses gives the optimum of the grid metallic pattern profile. The $Ga_{0.7}Al_{0.3}As$-Si system under air-mass yields a maximum efficiency of 30.4% with solar concentration of 750, and the GaAs-Ge coupled system yields a maximum efficiency of 25-5% with solar concentration of 600. (19 refs.)

120742 Photovoltaic cells illuminated in spectral splitting. II. Electric coupling of two different type of solar cells. A.Chave, J.R.Leguerre (Dept. de Phys., Faculte des Sci., Rabat, Morocco).

Rev. Phys. Appl. (France), vol.18, no.9, p.587-94 (Sept. 1983). In French.

For pt.I see ibid., vol.18, no.9, p.569-86 (1983). In the electric coupling of two different types of solar cells, the I(V) characteristic is modified. If the two cells are illuminated in spectral splitting with a dichroic mirror the cut-off energy at the point of maximum power efficiency is a function of the physical parameters values, slope of the mirror and solar concentration. The authors determine the optimization conditions of the system and in particular the variations of the grid metalization, shadowing ratio and cell temperature. The power conversion efficiency of the series coupling is similar to the isolated cells, but shows a very high sensitivity with respect to the variation of parameters. (no refs.)

120743 Management of excess energy in autonomous photovoltaic systems. E.Ofry, S.Singer (Faculty of Engng., Tel-Aviv Univ., Ramat Aviv, Tel-Aviv, Israel).

Sol. Energy (USA), vol.31, no.5, p.445-8 (1983).

A new method is described for the absorption of the excess energy generated in autonomous solar systems with the use of a variable complementary load. In order to use the excess energy for ventilation of the system, a fan is used as the complementary load. The current flow through the batteries is controlled according to the ampere-hour (A/hr) rule by regulating the fan in such manner that it absorbs all excess power. The energy control unit, including the fan, is part of a 1.6 kW peak, stand-alone, solar system built at Tel-Aviv University. (3 refs.)

120744 Solar cells—a technology assessment. J.R.Bolton (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).

Sol. Energy (USA), vol.31, no.5, p.483-502 (1983).

After a brief introduction including an analysis of limits on solar-cell conversion efficiencies and their dependence on temperature and light intensity, the bulk of the review deals with an extensive analysis of present and future solar-cell technologies. The three established technologies of Si cells, CdS/Cu_2S cells and GaAs cells are thoroughly examined in terms of manufacturing processes, advantages, disadvantages, efficiencies, applications and further reading. Several emerging technologies are then treated including the heat exchange method (HEM), the edge-defined film-fed growth (EFG) ribbon process, the dendritic web growth process, advanced Czochralski processes, alternative methods of fabricating cells from single-crystal Si such as ion implantation and MIS junctions, polycrystalline Si cells, amorphous Si cells, CdS/$CuInSe_2$ cells, GaAs cells and photoelectrochemical cells. In each case prospects for commercial development are assessed. Advanced concepts such as multi-junction cells, emerging semiconductor materials and organic cells are treated briefly. Concentrator systems and cells designed specifically for high light levels are analyzed and assessed as to commercial viability. Finally, the technology assessment is summarized in terms of ten specific points. (157 refs.)

120745 Surface modification of polycrystalline p-$CuInS_2$ and p-$CuInSe_2$ electrodes for improved solar cell performance. H.J.Lewerenz, H.Goslowsky (Hahn-Meitner-Inst., Kernforschung Berlin GmbH, Berlin, Germany), F.A.Thiel.
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.159-66 (July-Sept. 1983).
The improvement of output power characteristics upon etching and Ru^{3+}-chemisorption is reported for polycrystalline p-$CuInS_2$ and p-$CuInSe_2$, $CuInS_2$ in V(II)/V(III) redox solution exhibits a simulated solar conversion efficiency of 2.5% and is stable upon passage of 5000C. The existence of Fermi level pinning is discussed. (21 refs.)

120746 Chemical deposition of $Cd_{1-x}Hg_xS$ thin film electrodes for liquid-junction solar cells. J.F.McCann, R.C.Kainthla (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia), M.Skyllas-Kazacos.
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.247-51 (July-Sept. 1983).
Thin films of $Cd_{1-x}Hg_xS$ alloys have been prepared by chemical co-deposition from thiourea solutions. By increasing the Hg content in the alloys the band-gap of the mixed semiconductor was reduced to a value of 1.8 eV, approaching that of n-CdSe. The stability of the films in polysulphide under illumination was also tested. (8 refs.)

120747 The description of detecting signals by laser scanning optoacoustic microprobe [solar cells testing application]. Zhang Yousong, Wang Lianjie (Changchun Inst. of Appl. Chem., Acad. Sinica, Changchun, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.227-33
An experimental equipment of the laser scanning optoacoustic microprobe with a CW CO_2 laser as a light probe is described. It has been used in the investigation of the defects of sintering CdS/Cu_2S solar cells and other samples. The overlapping phenomena of the resonant wave of optoacoustic signals, the time-submerging phenomena of optoacoustic signals, the choice of the resolution for optoacoustic graph and the abnormal signal have been investigated. The results provide a new method that can be used for detecting some defects and for investigating polycrystalline surface regularity of sintering CdS/Cu_2S solar cells and other samples. (8 refs.)

120748 Fluorescent window as wavelength shifter for a polysulfide containing photoelectrochemical cell. N.Muller, J.Manassen (Dept. of Plastics Res., Weizmann Inst. of Sci., Rehovot, Israel).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.207-16 (July-Sept. 1983).
It is possible to obtain a gain in conversion efficiency of a photoelectrochemical cell by the use of a fluorescent wavelength shifter. If the dye is chosen so that its adsorption and fluorescence spectrum fits the photocurrent onset of the cell, gains in efficiency can be found. By the use of fluoresceine in methanol solution as the shifter and a polysulfide electrolyte, gains of up to 6% can be obtained with a $CdSe_{0.65}Te_{0.35}$ electrode and up to 10% with a CdSe electrode. The effect is also observed when using plastic sheets, doped with the dye. If the dimensions of the sheet exceed those of the cell on appreciable concentrating effect is observed. These effects are found either using a xenon light source or direct sunlight and are not corrected for constant quantum flux. With light which is richer in low wavelength radiation, much higher gains are obtained which is important for the concentration of diffusion light. Uranyl doped glass gives shifting effects, but these are too small to give a measurable gain in efficiency. (13 refs.)

86.30R Thermal energy conversion (heat engines and heat pumps)

120750 Energy from the ocean [OTEC].
Elektron Int. (Austria), no.7-8, p.198-202 (1983). In German.
It is estimated that 66% of the world energy consumption from fossil fuels, could be replaced by conversion of marine thermal energy in seaborne power stations utilising the temperature gradient of oceans, between the warm surface and colder water at a depth. The progress of research and development of pilot marine power schemes in the USA and Japan is reviewed, considering also prospects of production of other resources in parallel with the electric power generation, including desalination of water, minerals, fuels, foodstuffs and fertilisers. (no refs.) *S.R.*

120751 Air conditioning system study and application using thermosiphon. F.Matsuura, M.Mitsumachi, M.Nakao, M.Ichimura.
Electr. Commun. Lab. Tech. J. (Japan), vol.32, no.6, p.1373-82 (1983). In Japanese.
As heat generation per unit area from switching equipments increases, cooling in the switching room is frequently necessary, even in winter. The thermosiphon system has been studied as a cooling system in the high heat generating switching room. As no refrigerant circulation power is required in the thermosiphon system, it can be expected that energy consumption will be greatly reduced when this system is used with ordinary air conditioning system. They describe the system characteristics and the power estimation in an application example. (1 ref.)

120752 Heat pumps in district heating return pipelines to achieve greater temperature differences. U.Hezel (Energieversorgung Schwaben AG, Stuttgart, Germany).
Fernwaerme Int. (Germany), vol.12, no.4, p.202-6 (Aug. 1983).
The return pipeline is not a natural resource with its energy available for free. Instead, the medium has to be heated up in a heating plant, which means that both energy inputs at the heat pump, at the vaporizer and at the compressor drive demand the consumption of prime energy. Therefore, a heat pump at the return pipe cannot change some worthless energy from the environment into valuable energy as it does under other conditions. And thus it merely functions as a temperature transformer. Since any transformation process goes along with losses, the heat pumps increase the prime energy need of the network as a whole. (10 refs.)

120753 Ocean thermal energy conversion: historical highlights, status, and forecast. G.L.Dugger, D.Richards, E.J.Francis, W.H.Avery (Johns Hopkins Univ., Laurel, MD, USA).
J. Energy (USA), vol.7, no.4, p.293-303 (July-Aug. 1983).
In 1881, d'Arsonval conceived the closed-Rankine-cycle ocean thermal energy conversion (OTEC) system in which a working fluid is vaporized by heat exchange with cold water drawn from a 700-1200 m depth. In 1930, Claude demonstrated an open-cycle process in Cuba. Surface water was flash-vaporized at 3 kPa to drive a turbine directly (no secondary working fluid) and then was condensed by direct contact with water drawn from a 700-m depth through a 1.6-m-diam, 1.75-km-long cold-water pipe (CWP). From a ΔT of 14°C his undersized turbine generated 22 kW. In 1956 a French team designed a 3.5-MW (net) open-cycle plant for installation off Abidjan on the Ivory Coast of Africa and demonstrated the necessary CWP deployment. (46 refs.)

120754 Solar thermal engine systems using two stage concentrators. E.Kritchman (Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).
Sol. Energy (USA), vol.31, no.5, p.449-53 (1983).
The overall efficiency of a system including a solar paraboloidal concentrator augmented by a new type of nonimaging second stage concentrator (shaped like the bell of a trumpet) and coupled to a heat engine is investigated. Typically, a relative increase of 10 per cent in system efficiency was found due to the second stage. (9 refs.)

86.30S Photothermal conversion

120755 Future technological applications of rare-earth-doped materials. R.Reisfeld (Dept. of Inorganic & Analytical Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.243-51 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The possible uses of rare-earth-doped glasses or crystals are discussed in connection with (a) luminescent solar concentrators (LSCs), (b) light sources for fibre optics and (c) glass lasers. LSCs can be made from glasses which absorb the major part of the solar spectrum and concentrate the emitted fluorescence at wavelengths to which the photovoltaic cells are most sensitive. The ways in which such glasses can be prepared using a combination of UO_2^{2+} or Cr^{3+} with Nd^{3+} and Yb^{3+} are discussed. An economical analysis of the new type of collector is given. The use of Er^{3+} in fluoride glasses for fibre waveguide sources is outlined and recent results are presented. References are made to new laser materials based on Er^{3+} and Ho^{3+}. (33 refs.)

120756 Materials for photothermal solar energy conversion corrosion processes. W.F.Bogaerts (Inst. for Industrial Chem., Univ. of Leuven, Leuven, Belgium), C.M.Lampert.
J. Mater. Sci. (GB), vol.18, no.10, p.2847-75 (Oct. 1983).
Commerically or potentially available selective and non-selective absorber surfaces for solar heat collectors are reviewed and the state-of-the-art of solar collector corrosion processes is outlined. The review of available published literature has indicated that a lack of quantitative information exists, relative to corrosion of collector surfaces. Available information (mostly qualitative) on durability aspects and corrosion of solar receiver surfaces is described to indicate potential corrosion problem areas and corrosion prevention possibilities. An outline of appropriate durability tests is presented. (178 refs.)

120757 Optimum mass flow rate of water in a flat plate solar collector coupled with a storage tank and an organic Rankine cycle power loop. S.M.Eldighidy, I.S.Taha (Mech. Engng. Dept., King Abdulaziz Univ., Jeddah, Saudi Arabia).
Sol. Energy (USA), vol.31, no.5, p.455-61 (1983).
The optimum flat plate solar collector operation for maximizing solar organic Rankine cycle work output is investigated. A mathematical model for the flat plate solar collector water system integrated with a solar storage tank and an organic Rankine cycle loop is developed. The mass flow rate of water is searched for to obtain the maximum network output from the integrated system during 1 yr of operation. Curve fittings of thermodynamic properties of some chosen organic fluids (R-11, R-21 and R-113) are derived for computer use. The Hooke and Jeeves optimization technique is used to determine the optimum mass flow rate of water in the collector for different values of collector inner tube diameters and boiler heat transfer coefficient-area product. (8 refs.)

120758 High temperature solar gas heating comparison between packed and fluidized bed receivers. I. G.Flamant, G.Olalde (Lab. d'Energetique Solaire, Font-Romeu, France).
Sol. Energy (USA), vol.31, no.5, p.463-71 (1983).
Present investigation has been concerned with high temperature gas heating through porous media (SiC and ZrO_2 particles) in both fluidized bed receiver and a packed bed receiver. As a rule, gases being transparent to solar radiation, the porous media act as (i) an absorber, (ii) a gas-solid heat exchanger. The main thermal features of the systems have been measured using the 6.5 kW solar furnace of the 'Laboratoire d'Energetique Solaire' in Odeillo, France. Theoretical approach, temperature profile, gas outlet temperature as a function of mean flux density, and thermal efficiency of the receiver have been reported. Great improvements of the thermal efficiency may be expected from the newly designed receivers. (23 refs.)

120759 Simulation of an absorption heat pump solar heating and cooling system. M.O.McLinden, S.A.Klein (Solar Energy Lab., Univ. of Wisconsin, Madison, WI, USA).
Sol. Energy (USA), vol.31, no.5, p.473-82 (1983).
An absorption heat pump (AHP) is a heat driven heat pump utilizing the absorption process. A continuous, liquid absorbent AHP with chemical storage is modeled using mass and energy balances and assuming mass transfer equilibrium. This model is used with the TRNSYS program (Klein et al., 1981) to simulate the performance of an AHP in a residual solar-driven heating and cooling system. The effects of collector area for an AHP using the NaSCN-NH_3 chemical system are investigated for the Columbia, MO, Madison, WI, and Fort Worth, TX climates. The AHP system is compared to a conventional solar heating and cooling system and the effects of heat exchanger effectiveness, storage mass, additional thermal capacitance and alternative control strategies are studied for the Columbia climate. (13 refs.)

120760 Mathematical programming procedures to optimize the collector field subsystem of a power tower system. O.Coskunoglu (Dept. of General Engng., Univ. of Illinois, Urbana, IL, USA).
Sol. Energy (USA), vol.31, no.5, p.503-10 (1983).
The collector field of a solar tower system can be viewed as being composed of cells, each of which contains arrays of heliostats. Optimal design of a collector field involves determining the number, spacing and arrangement of heliostats within each cell so that the total cost per unit energy is minimized. This optimal design problem is formulated as a mathematical programming (MP) problem. This MP problem is then decomposed into two subproblems. The first subproblem is to determine the optimal spacing, arrangement, and amount of mirror surface in each cell so that the total energy collected is maximized. It is shown that the dynamic programming (DP) procedure can be employed to solve this subproblem. DP is particularly effective and efficient for this subproblem because it has the capability of determining the optimal design of one cell at a time, in a recursive fashion, until all cells are designed. This cellwise decomposition significantly simplifies the computational procedure. Furthermore, the optimal energy collected can be determined parametrically as a function of the total mirror area used in the field. This function is then utilized in the second problem: determination of the optimal total area so that the total cost over total energy, both functions of total area, is minimized. This yields a fractional programming problem. Mathematical structure of the above problems, advantages of using mathematical programming concepts, and future research needs are also discussed. (26 refs.)

120761 A solar powered diaphragm pump. R.Burton (Dept. of Mech Engng., Papua New Guinea Univ. of Technol., Lae, Papua New Guinea).
Sol. Energy (USA), vol.31, no.5, p.523-5 (1983).
The pump has its primary fluid (water) circulating between the collector array and a vapour generator in which the working fluid is boiled. Also a hydraulically coupled feed pump permits condensed working fluid to be returned from the condenser to the vapour generator. Finally poppet valves are used to control the inlet and exhaust of vapour to the pump. These valves are externally operated by a lever. Brief technical details of the pump are outlined. Test results and their analysis is presented. (3 refs.)

120762 The utilizability function. II. Validation of theory against data-based correlations. J.M.Gordon, Y.Zarmi (Jacob Blaustein Inst. for Desert Res., Ben-Gurion Univ. of the Negev, Sede Boger, Israel).
Sol. Energy (USA), vol.31, no.6, p.537-43 (1983).
For pt.I see ibid., vol.31, no.6 (1983). The results of a new theoretical approach to the calculation of annual utilizability are illustrated and validated against utilizabilities that are based on detailed meteorological data. The theory is applied to concentrating solar collectors with tracking about two axes, the polar axis, the horizontal east-west axis, and the horizontal north-south axis, for a wide range of clearness index values. A new simple analytic formula for annual utilizability and its accuracy for the case of concentrating collectors is presented. The theoretical results provide a method for the prediction of utilizability curves for concentrating solar collectors in any climate using the annual average clearness index only. This is valuable for geographical locations and climates which are not covered by existing correlations or for which insufficient meteorological data exists. (7 refs.)

120763 Analysis of concentrating collectors of energy from a distant point source. D.C.Look,Jr., P.D.Sundvold (Mech. & Aerospace Engng. Dept., Univ. of Missouri, Rolla, MO, USA).
Sol. Energy (USA), vol.31, no.6, p.545-55 (1983).
A procedure to analyze the energy leaving a point source, being reflected from one surface and striking another, was applied to focusing collectors. This very flexible method is independent of flux, magnitude of reflectivity, or location of the source. It was applied to parabolic and circular cylindrical reflector surfaces for three different materials when the source was a function of wavelength. The overall collector efficiency was found and the flux striking the receiver, the monochromatic collector efficiency as a function of wavelength, and the spatial collector efficiency as a function of the reflector position are present. (12 refs.)

120764 Thermodynamic equation of state approach for the choice of working fluids of absorption cooling cycles. A.L.Gomez, G.A.Mansoori (Dept. of Chem. Engng., Univ. of Illinois, Chicago, IL, USA).
Sol. Energy (USA), vol.31, no.6, p.557-66 (1983).
A methodology is developed for the application of thermodynamic equations of state of fluids and fluid mixtures in evaluating working fluid combinations of absorption cooling cycles. Thermodynamic phase equilibrium formulation of this methodology is presented. In the application of this approach for the comparative study and choice of working fluids, the Redlich-Kwong equation of state is used for a number of possible working fluid combinations for solar absorption cooling cycles. It is demonstrated that when limited experimental data is at hand this approach could be a useful screening technique for potential working fluid combinations. (18 refs.)

120765 An improved design method for solar water heating systems. J.E.Braun, S.A.Klein, K.A.Pearson (Solar Energy Lab., Univ. of Wisconsin, Madison, WI, USA).
Sol. Energy (USA), vol.31, no.6, p.597-604 (1983).
The f-chart method is an accurate tool for sizing domestic water heating systems with well-insulated tanks. A more general and fundamental design procedure called the ϕ,f-chart method has been developed for closed-loop liquid-based solar heating systems. In this paper, the $\bar{\phi},f$-chart method is extended to open-loop solar hot water heating systems. This method is an improvement over the f-chart method since it does not impose any restrictions on the water set temperature, water mains temperature, or the preheat tank loss coefficient. The procedure is general for both one-tank and two-tank systems. The modified $\bar{\phi},f$-chart method is still applicable to the closed-loop systems for which it was originally developed. (10 refs.)

120766 Daily efficiency of flat-plate solar air collectors for grain drying. Kuan-Chong Ting (Dept. of Mech. Technol., Univ. of Houston, Houston, TX, USA), G.C.Shove.
Sol. Energy (USA), vol.31, no.6, p.605-7 (1983).
Single cover flat-plate solar collectors incorporated into walls and roofs of farm buildings have been used to heat ambient air for low temperature grain drying systems. Large surface area and high airflow rate are common features of these collectors. The objective of this study was to develop a simple means of direct calculation of a collector's daily efficiency based on its design parameters. A computer simulation model developed by Ting (1980) was used to calculate the daily efficiencies of collectors under different operating conditions. The computer model was verified by Morrison's (1977) experimental data. Using the simulation results, a functional relationship was developed between the daily efficiencies of collectors and their design parameters. (8 refs.)

120767 Visualization of optical and thermal performance of solar components using encapsulated liquid crystals. W.M.Worek (Dept. of Mech. Engng., Illinois Inst. of Technol., Chicago, IL, USA).
Sol. Energy (USA), vol.31, no.6, p.613-15 (1983).
A nonintrusive, diagnostic tool using liquid crystals to indicate design modifications for improving the performance of solar components is described. This technique is demonstrated to study the transmittance of an array of spherical glass tubes used as a flat plate collector cover. (8 refs.)

120768 Five year testing with the Texaco coal gasification plant in Oberhausen-Holten (BRD). J.A.Toebes (N.V. KEMA, Arnhem, Netherlands), P.Ruprecht, R.Durrfeld.
Elektrotechniek (Netherlands), vol.61, no.8, p.582-9 (Aug. 1983). In Dutch.
Since 1978, Ruhrchemie, Ruhrkohle and Texaco have been developing Texaco's Coal Gasification Process. In the course of this 5 year effort the pilot plant in Oberhausen has produced 120 mm Nm^3 of synthetic gas from approximately 70000 metric ton of various coals. This paper presents the most important data about the process, gas, slag and process water environmental data plus technical information. (4 refs.)

120769 Investigations of sodium acetate trihydrate for solar latent heat storage, controlling the melting point. A.Ulman, B.Valentin (Isotope Dept., Weizmann Inst. of Sci., Rehovot, Israel).
Sol. Energy Mater. (Netherlands), vol.9, no.2, p.177-81 (July-Sept. 1983).
The addition of different acetate salts and acetamide lowers the melting point of sodium acetate trihydrate. Between 0-10% of lithium acetate dihydrate a linear relationship was observed between the melting point and the molal concentration, and the cryoscopic constant of $K_f = -6.8°C$ ($\pm 10\%$) was evaluated. Information on dissociation or dimerization of the various additives could be deduced from the results. The positive properties of sodium acetate trihydrate were retained. (10 refs.)

120770 Energy storage using the BaO_2-BaO reaction cycle. M.A.Fahim, J.D.Ford (Chem. Engng. Dept., Univ. of Kuwait, Kuwait, Kuwait).
Chem. Eng. J. (Switzerland), vol.27, no.1, p.21-8 (Aug. 1983).
The reversible reaction of the decomposition of BaO_2 and the subsequent oxidation of BaO was investigated to evaluate the possibility of using the reaction cycle for chemical energy storage. Isothermal and non-isothermal thermogravimetric techniques were used to study the kinetics of this reaction cycle. An activation energy of 33.6 kcal mol^{-1} was estimated for the forward reaction. In contrast, an activation energy of 12.4 kcal mol^{-1} was estimated for the reverse reaction. A marked decrease in the reaction reactivity was observed on repeated cycling. (12 refs.)

86.40K Hydrogen storage and technology

120771 Hydride storage devices for load levelling in electrical power systems. H.Buchner, E.Schmidt-Ihn, E.Kliem, U.Lang, U.Scheer.
Report EUR 7314 EN, Comm. European Communities, Luxembourg (1983), 135 pp. Contract 602-78-9-EHD.
The use of metal hydrides for the storage of hydrogen is investigated. Technical and economic aspects of using large stationary storage devices for electrical load levelling are discussed. Two storage capacities, 100 MWh (32000 m^3 of H_2) and 1000 MWh (320000 m^3 of H_2) are considered, and the units are based on low-temperature Ti, Cr, Mn hydrides, which can usefully store 2% hydrogen by weight. The thermodynamics, thermal conductivities, and kinetics of the hydrides were investigated and a method of improving their low thermal conductivity, through the addition of a metal powder, was developed. (34 refs.)

120772 Magnesium hydride for load levelling energy storage. B.Vigeholm.
Report EUR 8507 EN, Comm. European Communities, Luxembourg (1983), 108 pp. Contract EHC-14-009-DK.
Some of the magnesium properties essential to the applicability of the reaction $Mg+H_2 \leftrightharpoons MgH_2$ as a hydrogen storage system have been investigated. Three magnesium powders with particle size smaller than 50 μm average diameter were cycled, over 31, 71 and 151 cycles respectively, at 675K (400°C) and at absorption pressures, 2-3 MPa. The powders absorbed and desorbed 60-95% of the theoretically maximal amount of hydrogen given by stoichiometric MgH_2. The reaction rates changed negligibly over the extent of the experiments permitting the mentioned hydrogen exchange to be completed in less than 20 minutes. A high capacity, automatic cycling facility suitable for a more comprehensive investigation of the long term capacity parameters has been constructed and tested but not yet applied. (10 refs.)

86.70E Water

120774 Relationship between pelagic tar, fluorescence and biological markers in the South Atlantic Ocean. M.C.Kennicutt,II, J.M.Brooks (Dept. of Oceanography, Texas A&M Univ., College Station, TX, USA).
Mar. Pollut. Bull. (GB), vol.14, no.9, p.335-42 (Sept. 1983).
Surface pelagic tar concentrations in the equatorial South Atlantic Ocean were low (<0.001 to 14.6 mg m^{-2}). The tars were characterized by gravimetry, carbon isotopic composition, molecular compositions (gas chromatographically), sulphur content, total fluorescence spectra, and biological marker fingerprints. A total fluorescence technique was used to group the tars into two basic types. One type occurred at low concentrations and appeared to be due to chronic long-term oil pollution in the South Atlantic Ocean. The second group occurred at much higher concentrations and was associated with more coastal-influenced waters. Carbon isotopic composition and pristane/phytane ratios exhibited few geographical trends. (21 refs.)

120775 Dumping of radioactive wastes at sea. L.A.Konig (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Naturwissenschaften (Germany), vol.70, no.9, p.430-3 (Sept. 1983). In German.
The author gives an introduction to the problems of dumping at sea of radioactive wastes. A short survey is given on the dumping actions previously performed, the legal justification by international treaties, and the most important radioecological questions. (23 refs.)

86.70G Atmosphere

120776 An integral model for gravity spreading of heavy gas clouds. S.Byggstoyl (Inst. of Thermodynamics, NTH, Trondheim, Norway), L.R.Saetran.
Atmos. Environ. (GB), vol.17, no.9, p.1615-20 (1983).
An integral model for instantaneous release of heavy gas clouds in a calm environment is developed. The predicted frontal velocity differs from the gravity head expression assumed by other models in that it contains additional terms dependent upon both the cloud profile, cloud density, ground friction and air entrainment. The model is tested against experimental results and the agreement is satisfactory. A comparison with other models is also given. (10 refs.)

120777 Sea-breeze circulation and photochemical pollution in Athens, Greece. D.P.Lalas, D.N.Asimakopoulos, D.G.Deligiorgi (Dept. of Meteorology, Univ. of Athens, Athens, Greece), C.G.Helmis.
Atmos. Environ. (GB), vol.17, no.9, p.1621-32 (1983).
Analyses the effect of the sea-breeze on photochemical pollution in Athens, Greece. To this end, the SO_2, NO, NO_2, O_3 and CO concentrations, the vertical structure of the atmospheric boundary layer, the pollution emission rates and wind data are examined simultaneously for two typical days in August 1981 with well-defined sea-breeze circulation. The tendency of the complicated sea-breeze flow field to stratify the atmosphere and thus generate layers with different constituents affects the concentrations measured near the ground and causes relatively high oxidant levels at night. As inversion layers descend or disappear, abrupt changes and short-period oscillations in concentrations are found, and can be explained by a simple multilayer box model. (22 refs.)

120778 Characterization of the transport and dispersion of pollutants in a narrow mountain valley region by means of an atmospheric tracer. R.Willson, F.Shair (Chem. Engng., California Inst. of Technol., Pasadena, CA, USA), B.Reynolds, W.Greene.
Atmos. Environ. (GB), vol.17, no.9, p.1633-47 (1983).
Three atmospheric tracer experiments using sulfur hexafluoride (SF6), were conducted in a narrow mountain valley from 29 January-3 February 1982. These tests were performed in order to characterize the transport and dispersion of airborne pollutants around Telluride, Colorado which lies near the head of the San Miguel Valley. Particular attention was given to the influence of flow reversals upon pollutant dispersion, for which adequate numerical simulation is not yet available. Data from surface wind stations, pilot balloons and from an acoustic sounder were used to characterize the local meteorology. In this case, an upslope flow followed by a downslope drainage is required for emissions from a site on the slope to reach the upper valley about 10 km away. On the other hand, a downvalley flow followed by an upslope flow is required for emissions from the upper valley to reach the slope site. (11 refs.)

120779 Forecasting peak ozone levels. R.W.Simpson (School of Australian Environmental Studies, Griffith Univ., Nathan, Queensland, Australia), A.P.Layton.
Atmos. Environ. (GB), vol.17, no.9, p.1649-54 (1983).
Box-Jenkins (1970) time series models are used to predict peak afternoon O_3 levels. Data sets from three monitoring stations in Brisbane, Queensland, Australia, are used in the analysis, one of the stations being inner-city and the others being outer-city. It is found that univariate models using only the peak O_3 data-set at a site to predict future peak O_3 levels are unsatisfactory. However bivariate models using peak O_3 data from one site to predict peak O_3 levels at another site yield good results. However it is clear that these results only arise because the O_3 is formed in a well mixed layer over the region leading to a high degree of correlation between O_3 peaks throughout the region. (15 refs.)

120780 On the treatment of point source emissions in urban air quality modeling. C.Seigneur, T.W.Tesche, P.M.Roth, Mei-Kao Liu (Systems Applications Inc., San Rafael, CA, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1655-76 (1983).
Presents the development and evaluation of an urban air quality model, the Plume-Airshed Reactive-Interacting System (PARIS), that is capable of providing a detailed treatment of large point source emissions. The PARIS model treats these large point sources by embedding one or more reactive plume models into the Systems Applications urban airshed model, which is a three-dimensional gridded model governed by the atmospheric diffusion equation. These embedded reactive plume models are used to describe the chemistry and dynamics of large point source plumes and their interaction with the ambient urban environment. For purposes of evaluation and comparison, the Systems Applications urban airshed model and the PARIS model were applied to the St. Louis urban area for a one-day simulation and to the South Coast Air Basin (Los Angeles area) for a two-day simulation. (31 refs.)

120781 Comparing the calculated and measured aerosol concentrations and depositions around a metallurgical plant. B.Vanderborght, I.Mertens, J.Kretzschmar (Nuclear Engng. Res. Center, SCK/CEN, Mol, Belgium).
Atmos. Environ. (GB), vol.17, no.9, p.1687-701 (1983).
The aerosol concentration and deposition around a metallurgical plant are analysed. Measurements were carried out continuously over 14 months in order to obtain reliable data on the emissions, the local meteorological conditions and the ambient aerosol concentration and deposition levels. A bi-Gaussian dispersion model with source depletion is used for the simulation of the aerosol concentration and deposition. The dominating role of the fugitive compared with stack emissions was emphasized and the inevitable inaccuracies in the simulation of these sources is demonstrated. The fall-out velocity for the ISO deposit gauge was experimentally determined and interpreted. (20 refs.)

120782 Aircraft observations of regional transport of ozone in the northeastern United States. J.F.Clarke, J.K.S.Ching (Environmental Sci. Res. Lab., US Environmental Protection Agency Res., Triangle Park, NC, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1703-12 (1983).
A regional-scale aircraft sampling program was conducted during August 1979 to obtain data for validation of a regional-scale photochemical air quality simulation model and for studying the physical and chemical processes important in long-range transport of O_3 and O_3 precursors throughout the diurnal cycle. Three aircraft were deployed in a Lagrangian sampling mode to obtain continuous measurements of O_3, oxides of nitrogen, nephelometer scattering coefficient, and grab samples to be analyzed later for hydrocarbon species. The analysis reported is for a 24 h period during which relatively

high O_3 concentrations, generated within urban plumes, were transported from Ohio to the NE Corridor. (11 refs.)

120783 Measurements of benzene, toluene and xylenes in urban air. B.M.Wathne (Norwegian Inst. for Air Res., Lillestrom, Norway).
Atmos. Environ. (GB), vol.17, no.9, p.1713-22 (1983).
Results from measurements of benzene, toluene and xylenes in the city centre of Oslo are presented. The samples were collected in March and August/September 1980 at two of the stations used in an air pollution monitoring program. One was in a street canyon station and the other was a reference station. The sampling equipment was two charcoal filters in series, placed in a filter holder with a disk of glass fibre prefilter in front. Analysis was by high resolution gas chromatography. (13 refs.)

120784 In-situ, rapid response measurement of $H_2SO_4/(NH_4)_2SO_4$ aerosols in urban Houston: a comparison with rural Virginia. A.P.Waggoner, R.E.Weiss, T.V.Larson (Dept. of Civil Engng., Univ. of Washington, Seattle, WA, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1723-31 (1983).
Reports measurements taken in Houston, Texas of the chemical composition and degree of hydration of haze particles and compares these results with previously reported measurements taken in rural Virginia. The in-situ, real time measurements are based on detecting changes in particle light scattering extinction with changes in relative humidity and air temperature. With these methods one can determine fine particle mass and sulfate mass concentrations, and sulfate to ammonium ion molar ratio. (11 refs.)

120785 Size-differentiated composition of inorganic atmospheric aerosols of both marine and polluted continental origin. R.M.Harrison, C.A.Pio (Dept. of Environmental Sci., Univ. of Lancaster, Lancaster, England).
Atmos. Environ. (GB), vol.17, no.9, p.1733-8 (1983).
Atmospheric aerosols were sampled with a high volume impactor/diffusion battery system and the collected fractions analysed for their major water-soluble inorganic constituents. Sulphate, nitrate and chloride showed bimodal distributions; sulphate and nitrate were mainly associated with NH_4^+, having approximately log-normal distributions with modes at 1.0 μm. In unpolluted maritime air, chlorides appeared as salts of sodium and magnesium with average modes at *c.* 5 μm, whilst in polluted air masses significant concentrations of ammonium chloride sub-μm aerosols were detected. Sodium nitrate and sodium sulphate aerosols having average modes of *c.* 3.5 μm were observed in mixed maritime/polluted air masses. The dimensions of these particles indicate formation from absorption of H_2SO_4 and HNO_3 at the surface of marine NaCl particles. (15 refs.)

120786 Gas-to-particle conversion of sulfur in power plant plumes. II. Observations of liquid-phase conversions. N.V.Gillani (Washington Univ., St. Louis, MO, USA), W.E.Wilson.
Atmos. Environ. (GB), vol.17, no.9, p.1739-52 (1983).
For pt.I see ibid., vol.15, p.2293-313 (1981). The data from 5 days plume measurements under wet conditions are presented for the transport of the Labadie plume (St. Louis, Missouri) and the Cumberland and Johnsonville plumes (Tennessee). Collectively, the data include instances of liquid-phase reactions in wetted aerosols, as well as in rain, cloud and fog droplets. Detailed case studies are presented for two days of the Tennessee measurements when considerable plume-cloud interactions occurred, and on one of these days, the plumes were also sampled in light rain conditions. (16 refs.)

120787 Gas-to-particle conversion of sulfur in power plant plumes. III. Parameterization of plume-cloud interactions. N.V.Gillani, J.A.Colby (Washington Univ., St. Louis, MO, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1753-63 (1983).
Long-range plume transport-transformation models generally require bulk rates of chemical transformations averaged over plume segments whose spatial-temporal scales exceed those of most clouds. There arises, therefore, the need to average out over the entire plume segment the effect of processes occurring quite rapidly in random and discrete clouds which occupy only parts of the segment. An attempt is made to quantify the relationship between the fast in-cloud sulfate formation rate (K_t) and the slower bulk sulfate formation rate by liquid phase mechanisms in an entire plume segment (k_i). The ratio k_t/K_t is interpreted statistically. A quantitative expression is derived relating this plume-cloud interaction function to plume dimensions and to specific cloud-related quantities. A short-term and a long-term application of this plume-cloud interaction parameterization are attempted. (23 refs.)

120788 Visibility-pollutant relationships in southern Arizona. II. A winter/summer field study. W.P.Linak, T.W.Peterson (Dept. of Chem. Engng., Univ. of Arizona, Tucson, AZ, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1811-23 (1983).
For pt.I see ibid., vol.15, p.2421-32 (1981). Previous analysis of historical air quality data for the southern Arizona region (Linak and Peterson, 1981) suggested that sulfur containing aerosol species have a significant impact on local visibility. A field monitoring program was therefore undertaken to further characterize the particle size and chemical distribution of atmospheric aerosols in the area. Measurements of various gaseous pollutants, meteorological conditions and light-scattering coefficient were also included. Separate studies during winter and summer months were made to discern seasonal changes in aerosol behavior. In addition to detailed analysis of data for selected days, statistical analysis of the entire data set is performed. It is found that, while localized visibility correlate best with large-particle aerosol volume, regional haze is most affected by small-particle (sub μm) aerosol volume. (22 refs.)

120789 Statistical model applicable to contamination from a point source. M.Luisa Sanchez, F.Nieto, J.L.Sanchez, M.C.Ramos (Facultad de Ciencias, Univ. de Valladolid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.158-63 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The authors have studied the statistical distribution of the wind speed and concentrations of particulate, gaseous, and total fluorides, measured in 8 monitoring stations placed on the sector NE to NNE, in the neighbourhood of an aluminium factory. It was located at the town of Valladolid. After obtaining the statistical distribution in each monitoring station, they have stabilised an empirical statistical model, able to predict the particulate, gaseous and total fluorides concentrations in any meteorological conditions. The model was tested with satisfactory results, using the data obtained on a monitoring station placed on a NNW sector. (13 refs.)

120790 Complex I and II model performance evaluation in Nevada and New Mexico. P.D.Gutfreund (Systems Applications Inc., San Rafael, CA, USA), C.S.Liu, B.R.Nicholson, E.M.Roberts.
J. Air Pollut. Control Assoc. (USA), vol.33, no.9, p.864-71 (Sept. 1983).
The COMPLEX I and COMPLEX II Gaussian dispersion models for complex terrain applications have been made available by EPA. A model performance evaluation exercise involving three of the available options with both COMPLEX models was carried out using SF_6 tracer measurements taken during worst-case stable impaction conditions in complex terrain in southern Nevada. The models did not reproduce observed concentrations on an event by event basis, as correlation coefficients for 1-h concentrations of 0-0.3 were exhibited. When observed and calculated cumulative frequency distributions for 1-h and 3-h concentrations were compared, a close correspondence between observations and concentrations calculated with COMPLEX I, ,IOPT(25)=2 or 3 was noted. (15 refs.)

120791 A surface-corrected Gaussian model for elevated sources. T.J.Overcamp (Environmental Systems Engng., Clemson Univ., Clemson, SC, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1111-15 (June 1983).
A Gaussian model for continuous elevated sources is developed which uses a continuous distribution of ground-level sources to replace the use of the image source. For the case of Fickian diffusion with uniform wind, this model is mathematically identical to the conventional Gaussian model with the image source, and therefore, provides a more physically realistic model to justify the use of the image source. For the general, non-Fickian case, the predictions of the surface-corrected model and the conventional model differ. (9 refs.)

120792 Comparative studies of radionuclides from global fallout and local sources in ground level air and sewage sludge. B.Erlandsson, T.Ingemansson (Dept. of Nuclear Phys., Univ. of Lund, Lund, Sweden), S.Mattsson.
Water, Air & Soil Pollut. (Netherlands), vol.20, no.3, p.331-46 (Oct. 1983).
The presence of activation products in the environment released into the air from a nuclear power station is studied in sewage sludge and ground level air. The measured time variation of the ^{60}Co concentration in sludge and ground level air is found to be in good agreement with the reported variation in release rate to the air from the power station when the prevalent wind direction is taken into account. The ratio between the ^7Be normalized concentration in sludge and ground level air is studied and is found to be about 1 for radionuclides due to global fallout but less than 2×10^{-3} for ^{60}Co. The conclusion is that ^{60}Co spreads from a local source (a nuclear power station) and to a considerable degree is dry deposited on the ground and then washed off by rain. (12 refs.)

86.70J Noise

(see also 43.50 Noise, its effects and control)

120793 Long term sleep disturbance due to traffic noise. M.Vallet, J.-M.Gagneaux, V.Blanchet, B.Favre, G.Labiale (Inst. de Recherche de Transports, Bron, France).
J. Sound & Vib. (GB), vol.90, no.2, p.173-91 (22 Sept. 1983).
This contribution to the evaluation of the effects of traffic noise on sleep disturbance is focused on the responses of people living near a main road. Experiments were carried out in the homes of subjects who had habitually been exposed to noise for periods of more than four years. The chronic changes in overall sleep patterns and the temporary sleep responses to particular noise events caused by traffic are demonstrated. Young people show mainly stage 3 and 4 deficits whilst older people show REM sleep deficits. The cardiac response to noise during sleep was also examined. These results highlight that both long term average and peak levels are important in assessing sleep disturbance. The threshold levels, measured inside the bedroom and above which sleep quality starts to become impaired, are 37 $L_{eq}(A)$ and 45 dB(A)$L_{p\ max}$, respectively. For the type of traffic studied these two levels are coherent and it is therefore possible that a single noise index $L_{eq}(A)$, is sufficient to scale sleep disturbance. (26 refs.)

120794 Sampling of carbonaceous particles in the atmosphere. B.R.Appel, Y.Tokiwa, E.L.Kothny (Air & Industrial Hygiene Lab., California Dept. of Health Services, Berkeley, CA, USA).
Atmos. Environ. (GB), vol.17, no.9, p.1787-96 (1983).
A method for measurement of atmospheric carbonaceous particulate matter is proposed and evaluated. A diffusion denuder, placed ahead of a filter, is used to exclude vapor-phase organic compounds which might be retained by adsorption on the filter. The carbonaceous material lost by volatilization from the filter after collection is retained with a fluidized bed of powdered Al_2O_3. The efficiencies of the denuder and Al_2O_3 are evaluated with vapor phase phenanthrene and octadecane. Atmospheric sampling was done at two urban and one background site in California using the proposed technique in parallel with conventional hi-vol and dichotomous samplers. (25 refs.)

120795 Use of the α spectrometer to simultaneously measure the equilibrium of atmospheric daughters of Rn and Tn. J.Gonzalez Suarez, F.Castro Del Val, Roque.Casanova,J.L. (Facultad de Ciencias, Univ. de Valladolid, Valladolid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.152-7 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
A technique for the simultaneous measurement of the degree of radioactive equilibrium between the atmospheric short-lived radon-222 daughters and the corresponding thoron (radon-220) daughters through the individualized measurement of the concentrations of these elements by α-spectrometry is described. (13 refs.)

120796 Electron-energy absorption used for the measurement of superficial densities of air-pollution samples on thin membrane filters. B.Denecke (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1311-22 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
A sampling and analysis method to measure dust concentrations in air is described. The dust was deposited on membrane filters, the superficial density of which was measured by an electron-energy-absorption method. Internal-conversion electrons from the ^{109}Cd decay were used as the electron source. The electron detector was a gas-proportional counter operated at atmospheric pressure with a 90% Ar+10% CH_4 gas flow. Detected superficial-density differences ranged from 0 to 400μg/cm^2 with an estimated accuracy of 20μg/cm^2. The measurement process was automated using a computer-controlled sample changer. About 8000 samples were taken and analysed during 18 months. In addition to the total amount of dust the blackening index of the dust stains was also measured by an optical reflection method. (15 refs.)

120797 A dynamical estimation method of environmental noise system based on the quantized level measurement contaminated by the background noise. M.Ohta, K.Hatakeyama (Faculty of Engng., Hiroshima Univ., Higashi-Hiroshima, Japan).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.777-84
The authors have attempted to establish a unified methodology for removing the undesirable effects of the background noise and the quantization errors of digital measuring apparatus, on the estimates of unknown random signals in the actual noise environment, through some improvement of the Bayes theorem. The validity and the effectiveness of the proposed estimation method are experimentally confirmed by applying it to the actually observed data of room acoustics. (4 refs.)

87.10 GENERAL, THEORETICAL, AND MATHEMATICAL BIOPHYSICS

(inc. logic of biosystems, quantum biology, and relevant aspects of thermodynamics, information theory, cybernetics, and bionics)

120798 The reverberator in an active medium. Analytical results. A.S.Mikhailov, V.I.Krinskii (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.5, p.919-25 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.875-9 (1982). [received: Sept. 1983]
An approximate analytical method is outlined for calculating a rotating helical wave in an active medium based on transition to a system of coordinates linked with the wave front. An equation is derived for the helical wave and a method is devised for setting the boundary conditions for solving this equation. As an illustration of the Rinzel-Keller model the dependence of the wave frequency and wavelength of the reverberator and helical wave rotating about the aperture on the parameters of the medium are considered. (12 refs.)

120799 Numerical study of the stochastic behaviour of a simple biological system. V.V.Alekseyev, A.N.Kornilovskii (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.935-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.890-4 (1982). [received: Sept. 1983]
A set of differential equations modelling the dynamics of metabolism is studied. The presence in phasic space of a strange attractor suggests that stochastic behavior is a common phenomenon in biophysics. It is shown that the size of the attractor determines the sensitivity threshold of the system for each of the dynamic variables. (9 refs.)

120800 Physical chemistry and respiratory control—a mathematical model. J.Silverberg (Boston Univ., Boston, MA, USA), P.Stewart, R.Hopkins.
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.15-4/1-10
This model explores the interactions between the 'chemical' system and the 'physiological' system. In the respiratory control model formed by the inclusion of both these systems, the determinants of the ventilatory rate, as well as the events which arise from the consequences of that ventilatory rate are both calculated from a firm theoretical base. The model presented combines more detailed solution chemistry and thermodynamics with traditional physiological information concerning capillary function and carbon-dioxide aspects of respiratory control. It satisfactorily predicts the electrolyte, acid-base, and CO_2-related behavior of the respiratory system, including details of the specific compositions of arterial and venous plasma and red cells, as well as normal ventilatory parameters. (see also 36.20 Macromolecules and polymer molecules)

120801 Hydrophobic moments and protein structure. D.Eisenberg, R.M.Weiss, T.C.Terwilliger, W.Wilcox (Dept. of Chem., Univ. of California, Los Angeles, CA, USA).
Faraday Symp. Chem. Soc. (GB), no.17, p.109-20 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
The structure of a protein can be analysed in terms of what may be called the 'hydrophobic moments' of (1) the entire molecule and (2) of the segments of secondary structure that make up the polypeptide chain. The zeroth moment is defined as the sum of the hydrophobicities of the amino-acid residues of the structure under consideration; it is the analogue of the net charge of a cluster of point charges. The first moment, or hydrophobic dipole moment, is the analogue of the electric dipole moment of a cluster of charges. Just as the electric moment measures the asymmetry of the charge distribution, the hydrophobic dipole moment measures the amphiphilicity (asymmetry of hydrophobicity) of the structure. A large hydrophobic dipole moment indicates that a structure is predominantly hydrophobic on one side and predominantly hydrophilic on the other. A quadrupole hydrophobic moment may be similarly defined. It indicates whether a protein is more hydrophobic in its interior (as for a globular protein in aqueous solution) or at its surface (as for a membrane protein). The authors examine the hydrophobic dipole moments in the known structures of nine globular proteins and find that the moments of neighbouring segments tend to point towards each other. This suggests that the hydrophobic dipole can serve as a simple and pictorial summary of some of the forces at work in the folding of proteins. They have also found that the interactions of some macromolecules with an apolar-polar interface can be conveniently described in terms of the hydrophobic moments of the molecule and a 'hydrophobic field' which reflects the hydrophobicity of the environment. (21 refs.)

120802 Dynamics of native globular proteins in terms of dihedral angles. T.Noguti, N.Go (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3283-8 (Sept. 1983).
Problems are discussed that are associated with extension of the time-independent method of conformational energy analysis of biopolymers, in which only dihedral angles are treated as independent variables, to time dependent one. For molecules with small amplitudes of fluctuations, internal motions of atoms due to variations of dihedral angles are shown to be defined with respect to a coordinate system which is defined by the Eckart's condition and is moving with the molecule. Computationally efficient and explicit expressions are given (i) for a coefficient matrix to convert small changes in dihedral angles to small atomic displacements from the mean positions, and (ii) for a coefficient matrix in the expression of the kinetic energy of internal motions in terms of first order time derivatives of variable dihedral angles.

120803 Spin-one lattice gas model for isotherm-reversal in spin-labelled lipid monolayers. K.G.Chakraborty, J.F.Baret (Dept. de Phys. des Liquides, Univ. de Provence, Marseille, France).
Phys. Status Solidi b (Germany), vol.119, no.1, p.61-71 (1 Sept. 1983).
A suitably extended version of a spin-one lattice gas model, embodying the basic ideas of Cadenhead and Muller-Landau (1974, 1975) and Bell and Dunne (1978) is employed to study the 'isotherm reversal' appearing in the pressure-area phase diagram of spin-labelled monolayers. Considering the nine different configurations of molecules as conceived by Bell and Dunne the Hamiltonian is developed and the molecular field approximation is applied to derive the expression for pressure. The phase diagrams are drawn for various values of the model parameters and it is seen that the isotherm-reversal is a characteristic of the model itself. Unlike the one-dimensional model of Bell and Dunne, the present model shows the phase transition from a liquid-expanded to a liquid-condensed phase. (10 refs.)

120804 Thermal instability in lamellar phases of lecithin: a planar undulation model. A.G.Petrov (Inst. of Solid State Phys., Acad. of Sci., Sofia, Bulgaria), G.Durand.
J. Phys. Lett. (France), vol.44, no.18, p.L793-8 (15 Sept. 1983).
Under heating, a hydrated egg lecithin multilamellar sample in a planar geometry (lamellae normal to the plate) shows a periodic striation instability, followed at higher heating by the so-called 'ear-like' domains. The authors first demonstrate that a normal lamellae contraction under heating can result into a lamellar undulation instability in a planar sample, as well as in a homeotropic geometry. Assuming a strong anchoring of the lamellae on the plates, with the force free condition on the lamellae outer surface, the undulations are localized close to the plates. The spatial period and the threshold are estimated. Observations of hydrated DLL samples of various thicknesses allow them to identify the periodic striations with this localized undulation instability. (7 refs.)

120805 Effect of high pressure on a lipid non-bilayer phase. E.L.Chang, P.Yager (Naval Res. Lab., Washington, DC, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.125-9 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The authors have developed a new optical method to monitor the lamellar to hexagonal$_{II}$ phase transition of lipids under high pressure. This method depends on the changes in the transmittance property of a pelleted sample inside a windowed pressure cell. The pelleted sample is opaque to a focused He-Ne laser beam below the phase transition whereas the compacted lipid becomes translucent above the phase transition temperature. The change in transmitted light intensity is about an order of magnitude and allows them to identify the onset of the phase transition to within 0.1°C. They have found a large hysteresis in the heating and cooling scans of egg phosphatidylethanol-

amine that is independent of the rate of scan. In addition, pressure increases the phase transition temperature of the lamellar to hexagonal$\mathrm{I_I}$ phase indicating that the hexagonal$\mathrm{I_I}$ phase is destabilized with respect to the lamellar phase under pressure. (4 refs.)

120806 Orientation of the primary donor in single crystals of Rhodopseudomonas viridis reaction centres. P.Gast, M.R.Wasielewski, M.Schiffer, J.R.Norris (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Nature (GB), vol.305, no.5933, p.451-2 (29 Sept. 1983).
Reports the electron paramagnetic resonance (EPR) spectra of the photochemically derived triplet state of the primary donor of R. viridis in a single reaction-centre crystal as a function of crystal orientation in the magnetic field. Analysis of these spectra allows the authors to assign the orientation of the triplet-state axis system of the primary donor relative to the crystal axis system. (8 refs.)

120807 Mutations and the conformational stability of globular proteins. M.G.Grutter (Univ. Basel, Basel, Switzerland), R.B.Hawkes.
Naturwissenschaften (Germany), vol.70, no.9, p.434-8 (Sept. 1983).
The elucidation of the three-dimensional structure of now over 100 proteins provides the basis for describing the nature of interactions stabilizing native protein structure. To understand the forces responsible for maintaining the native structure, it is necessary to analyze the contributions of the specific forces like a hydrogen bond, a salt bridge or a hydrophobic interaction to the overall stability of a protein. Using mutant proteins carrying a single amino acid substitution, specific interactions in a protein can be altered and the effect can be studied. The results of such studies on stability variants of human haemoglobin and of T4 phage lysozyme are described. (25 refs.)

120808 S_1 absorption of chlorophyll-a in the red region. D.Leupol (Central Inst. of Optics & Spectroscopy, Acad. of Sci., Berlin, Germany), J.Ehlert, S.Oberlander, B.Wiesner.
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.345-50 (16 Sept. 1983).
To clear up controversial results of excited-singlet (S_1) absorption of monomeric chlorophyll-a solutions in the red spectral range, non-linear absorption measurements were performed at $\lambda=670$ and evaluated in analytic and numerical terms. A large S_1 absorption cross section has been confirmed at 670 nm $(\sigma_{S1}(670))=0.71\sigma_{S0}(670)$ and excited-singlet absorption underlined as the cause of the anomalous short-wave emission of the Chl-a laser. The S_1 absorption cross sections for Chl-a/dioxan in the range 800-870 nm are given. (16 refs.)

120809 Application of proton NMR spectral editing techniques for selective observation of N-H protons in an actinomycin D complex with a tetranucleotide duplex. D.G.Reid, D.M.Doddrell, K.R.Fox, S.A.Salisbury, D.A.Williams (Univ. of Chem. Lab., Univ. of Cambridge, Cambridge, England).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5945-6 (7 Sept. 1983).
The complexity of many biological molecules can make proton NMR spectral assignment a challenging task. This task would be facilitated by any technique allowing selective observation of a certain type of resonance. Such a technique is potentially furnished by editing methods that permit exclusive observation of protons directly bonded to a spin-$^1/_2$ nucleus. If this nucleus can be introduced into a molecule selectively, the scope of the method is considerably increased. The assignment of N-H protons is of particular importance considering their role in the stabilization of protein and nucleic acid secondary structure. Two factors can complicate such assignments, analog to digital conversion limitations accompanying the necessity of working in H_2O, and possible overlap with other signals, especially in the aromatic region. The ready availability of many antibiotics biosynthetically enriched in ^{15}N provides the possibility of using editing techniques for spectral simplification in complexes of these antibiotics with suitable receptors. Uniformly enriched actinomycin D^- may be prepared from Streptomyces parvulus grown on a medium containing $Na^{15}NO_3$ as the sole nitrogen source. The complex formed between the drug and the duplex of the self-complementary tetranucleoside triphosphate d(A-G-C-T) is in slow exchange on the ^{1}H NMR time scale below 30°C. NMR spectra were acquired on a Bruker WH-400 modified to pulse protons and 15N simultaneously and observe protons. (7 refs.)

120810 Charged amino acids as spectroscopic determinants for chlorophyll in vivo. J.Eccles, B.Honig (Dept. of Biochem., Columbia Univ., New York, NY, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.16, p.4959-62 (Aug. 1983).
Proposes that the large spectroscopic red shifts observed for chlorophyll (Chl) and bacteriochlorophyll (BChl) in vivo may be due to charged amino acids in the binding site. Molecular orbital calculations of the transition energies of Chl in the field of external charges are carried out. The calculated wavelength shifts induced by these charges are comparable in magnitude to those observed in vivo. Moreover the size of the shifts increases in the order BChl b>BChla>Chla, which is the observed trend. The ability of the calculations to account for both the absolute and relative magnitudes of the wavelength shifts argues for the validity of the model. Further indirect support comes from the recent demonstration that charged amino acids are responsible for the colors of visual pigments and bacteriorhodopsin. In addition to their effects on spectra the presence of external charges induces large changes in the ionization potential of Chl molecules and thus might explain the in vivo alteration of the oxidation potentials in reaction centers. 87.16 BIOTHERMICS

120811 Relationship between sensory nerve conduction and temperature of the hand. J.Koczocik-Przedpelska, S.Gorski, E.Powierza (Dept. of Pathophysiology of Locomotor Organs, Inst. of Orthopaedic Surgery & Rehabilitation, School of Medicine, Poznan, Poland).
Acta Physiol. Pol. (Poland), vol.34, no.1, p.21-8 (Jan.-Feb. 1983). [received: Sept. 1983]
Electroneurographic and thermographic investigations were carried out in 32 persons. Sensory nerve conduction velocity, the amplitude of sensory nerve potential, subjective and objective electrical thresholds were determined during the stimulation of each finger. Thermograms were taken before and after the standard cooling test. Statistical analysis has revealed that all the results of electroneurographic and thermographic parameters obtained from the fingers of the same person as well as of all investigated persons are directly connected. Highly significant ($p=0.001$ and 0.01) correlations of second degree were found between electroneurographic and temperature parameters. (6 refs.)

120812 Nonvisual color perception: a critical review. P.K.Kaiser (York Univ., Downsview, Ontario, Canada).
Color Res. & Appl. (USA), vol.8, no.3, p.137-44 (Fall 1983).
Since the last century, there have been a number of claims that people can identify and discriminate color with their fingers. The most completely documented evidence for these claims, begining in 1963, is critically reviewed. It was the hope of the early investigators of this phenomenon that this ability would some day be useful for the blind. The best evidence suggests that people are capable of making certain temperature discriminations and that objects of different reflectances can be discriminated on this basis. The temperature exchange stems from the infrared energy emitted by the skin. Research that has presented evidence for finger color perception was often shown to have methodological problems, including learning to discriminate stimuli by texture cues and failure to adequately blindfold observers and prevent use of visual information. The present review concludes that the phenomenon of using the fingers to 'see' color does not and will not, in the forseeable future, provide any additional hope for the blind. (30 refs.)

120813 Cryobiology, the position in the system of life sciences, its contents and terminology. R.Klen (Faculty Hospital, Hradec Kralove, Czechoslovakia).
Indian J. Cryog., vol.8, no.2, p.67-73 (1983).
Cryobiology deals with life under suboptimal temperatures, and studies therefore the effects of low temperature upon life processes. Like many other analogous disciplines, cryobiology has a general part, and a specialized part which deals with either botanical or zoological aspects, predominantly at the level of cytology. The chief subject matter of the botanical applied branch are questions associated with the adaptation of plants to low temperature; among the main problems of the zoological applied branch are preservation by cold and deep-freeze-drying of biological material, and a number of purely medical applications, such as hypothermia, cryosurgery, and treatment of frostbites. (no refs.)

120814 Heat and water vapor transport in the human upper airways at hyperbaric conditions. M.L.Nuckols (Naval Coastal Systems Center, Panama City, FLA, USA), J.L.Zumrick, C.E.Johnson.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.24-30 (Feb. 1983). [received: Oct. 1983]
Heat and mass transfer mechanisms have been characterized in physical models of human cadaver airways to simulated depths of 305 m with various gas mixtures. Such characterizations offer a detailed understanding of the effects of environmental pressures, gas composition, and respiratory rates (RMV) on the body cooling capacity of the respiratory airways. Empirical heat transfer relationships in the form $Nu=ARe^NPr^{1/3}$ are derived for the oral and nasal passageways during inhalation and exhalation flows. Nu, Re, and Pr are the dimensionless Nusselt, Reynolds, and Prandtl numbers, respectively. The Nusselt and Reynolds numbers are based on the diameter and gas flow rate in the trachea and are applicable to Reynolds number values up to 70,000. (22 refs.)

120815 Model simulation of heat and water transport dynamics in an airway. G.M.Saidel (Dept. of Biomedical Engng., Case Western Res. Univ., Cleveland, OH, USA), K.L.Kruse, F.P.Primiano,Jr..
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.188-93 (May 1983). [received: Oct. 1983]
Heat and water transport processes in the respiratory tract depend on environmental conditions, breathing patterns, and the physiological state of the respiratory system. To study these processes, the authors have developed a mathematical model of the dynamics of temperature and water vapor in the radial and axial directions of an idealized trachea. The model is expressed as two implicit finite-difference equations and solved using an alternating-direction algorithm. Using these equations, the authors simulated the effects of inspired gas temperature and humidity, velocity profile, and flow rate on heat and water transport between the gas and airway wall. Under inspired gas conditions of low temperatue or high relative humidity, supersaturation occurs. Increasing either the velocity gradient at the wall or the flow rate increases the heat and water transport rates. However, these rates change by only 10 percent when the velocity gradient is doubled, and by about 35 percent when flow rate undergoes a two-fold change. The model can be used with in-vivo data from the trachea to test hypotheses concerning normal and abnormal heat and water transport. (15 refs.)

87.20 MEMBRANE BIOPHYSICS

120816 Permeability of the canine visceral pleura. G.T.Kinasewitz, L.J.Groome, R.P.Marshall, J.N.Diana (Dept. of Medicine, Louisiana State Univ. Medical Center, Shreveport, LA, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.121-30 (July 1983).
Fluid and protein movement across the pulmonary endothelial membrane (PEM) and adjacent mesothelial layer of the visceral pleura was quantitatively analyzed in terms of a two-compartment model of fluid exchange. The left lungs of 13 spontaneously breathing anesthetized dogs were enclosed in a water-impermeable membrane, creating a visceral pleural space; fluid flux was determined as the filtration or reabsorption of water and protein in the visceral pleural space. Aortic, pulmonary arterial, left atrial, and pleural pressures were monitored; oncotic pressure was calculated from the protein concentration of plasma and pleural fluid. It is concluded that it is the pulmonary endothelial membrane that determines the rate and composition of visceral pleural fluid flux in response to hydrostatic and oncotic gradients in the intact animal. 120817 Study of the mobility of the protoplasm in the cells of the alga Nitella by optical Doppler spectroscopy. M.V.Yevdokimov, A.V.Priyezzhev, Yu.M.Romanovskii, Ye.B.Chernyayeva (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.965-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.918-20 (1982). [received: Sept. 1983]
Optical Doppler spectroscopy has been used to study the restoration of the flow of protoplasm in Nitella cells after shock induced by electrical stimulation. Spectra are presented which show two components: the Doppler component proper and a low frequency component. These components are discussed. (9 refs.)

120818 Motility and mechanosensitivity of macrocilia in the ctenophore Beroe. S.L.Tamm (Marine Biological Lab., Boston Univ., Woods Hole, MA, USA).
Nature (GB), vol.305, no.5933, p.430-3 (29 Sept. 1983).
Reports that macrocilia on the ctenophore Beroe beat discontinuously with separate effective and recovery strokes, resulting in 'split-cycle' waves of metachronal coordination. This new pattern of ciliary beating is used to investigate the motile responses of cilia to controlled mechanical stimuli during each phase of the beat cycle. (25 refs.)

87.25D Biological transport; cellular and subcellular transmembrane physics

120819 Permeability of premature lamb lungs to protein and the effect of surfactant on that permeability. A.Jobe, M.Ikegami, H.Jacobs, S.Jones, D.Conaway (Dept. of Pediatrics, Harbor-Univ. of California Medical Center, Torrance, CA, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.169-76 (July 1983).
The permeability of the alveolar epithelium of prematurely delivered lambs supported on ventilators was studied by following the movement of radiolabeled albumin and protein into and out of the airways. Twenty-two lambs (approximately 136 days gestational age) were killed at times ranging from birth to 3 h of age. As assessed by alveolar wash, 11.5%/h of ^{125}I-albumin administered to these lambs in fetal lung fluid at birth left the airways, while 1.7%/h of the arterially injected dose of ^{131}I-albumin entered the airways. Total protein increased in the alveolar washes by 60 mg.kg^{-1}.h^{-1}, concurrently, with an increase in the quantity of inhibition by the soluble proteins of the surface tension lowering properties of surfactant. This large bidirectional flux of protein indicates very abnormal permeability properties of the alveolar epithelium of prematurely delivered and ventilated lambs with normal blood gases. To assess the effect of surfactant on the permeability, one lamb of each of eight pairs of twin lambs was treated with 50 mg/kg natural sheep surfactant at birth, and all 16 lambs were supported on ventilators for 3 h. The surfactant treatment significantly decreased the radiolabeled albumin flux and the total protein present in the alveolar washes. (25 refs.)

120820 Pulmonary uptake of mannitol as an index of changes in lung epithelial permeability. S.M.Taylor, H.Downes, C.A.Hirshman, J.E.Peters, D.Leon (Dept. of Pharmacology & Anesthesiology, Oregon Health Sci. Univ., Portland, OR, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.614-18 (Aug. 1983).
To develop a simple, inexpensive, and nontoxic test for changes in bronchial permeability the authors have employed a specific gas chromatographic assay to measure the uptake of mannitol from the lung after administration of an intratracheal aqueous bolus (8 ml of 5% solution). They have tested the ability of their method to detect the known increase in lung epithelial permeability elicited by challenge of previously sensitized animals with aerosols of Ascaris suum antigen. In Ascaris-sensitive Besenji-Greyhound dogs, antigen challenge significantly increased the rate of appearance and peak plasma level of mannitol after administration of the intratracheal bolus. Peak plasma mannitol levels averaged 25 ± 3 (SE) μg/ml in dogs challenged with Ascaris antigen aerosols, and 14 ± 2 μg/ml in the same animals in separate control experiments employing saline aerosols. The method presented could be readily applied to animal and human studies as a simple, inexpensive, and nontoxic indicator of lung epithelial permeability. (22 refs.)

120821 Mutant analysis shows that the Ca^{2+}-induced K^+ current shuts off one type of excitation in Paramecium. Y.Saimi, R.D.Hinrichsen, M.Forte, C.Kung (Lab. of Molecular Biology, Univ. of Wisconsin, Madison, WI, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.16, p.5112-16 (Aug. 1983).
Two mutants of Paramecium tetraurelia, called 'pantophobiacs', were found to lack most of the slow Ca^{2+}-induced K^+ outward current. Passive properties, the transient Ca^{2+}inward current, and the fast depolarization-induced K^+ outward current remain normal. The mutant defect reduces the ability to shut off a normal, excited state of the membrane and results in repeated, long backward swimming instead of the wild-type jerks in response to a variety of ions, to heat, and to touch. (44 refs.)

120822 Abnormal ion permeation through cystic fibrosis respiratory epithelium. M.R.Knowles, M.J.Stutts, A.Spock, N.Fischer, J.T.Gatzy, R.C.Boucher (Dept. of Medicine, Univ. of North Carolina School of Medicine, Chapel Hill, NC, USA).
Science (USA), vol.221, no.4615, p.1067-70 (9 Sept. 1983).
The epithelium of nasal tissue excised from subjects with cystic fibrosis exhibited higher voltage and lower conductance than tissue from control subjects. Basal sodium ion absorption by cystic fibrosis and normal nasal epithelia equalled the short-circuit current and was amiloride-sensitive. Amiloride induced chloride ion secretion in normal but not cystic-fibrosis tissue and consequently was more effective in inhibiting the short-circuit current in cystic fibrosis tissue epithelia. Chloride ion-free solution induced a smaller hyperpolarization of cystic fibrosis tissue. The increased voltage and amiloride efficacy in cystic fibrosis reflect absorption of sodium ions across an epithelium that is relatively impermeable to chloride ions. (20 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

120823 Bioelectric properties and ion transport in the isolated frog lung. T.Tyrakowski, G.Szymkowiak, A.Kubacki (Dept. of Pathophysiology, School of Medicine, Poznan, Poland).
Acta Physiol. Pol. (Poland), vol.34, no.1, p.117-25 (Jan.-Feb. 1983). [received: Sept. 1983]
The aim of the study is the comparison of the basic features of the isolated amphibians lungs (R. temporaria with B. marinus and R. catesbeiana) and the evaluation of this preparation as a model of the chloride transport. Measurements of the bioelectric properties of the isolated lungs were performed according to Ussing (1951), Chloride unidirectional fluxes were measured in chambers described by Helman (1971) according to Gatzy (167). The spontaneous potential difference of the lung was of the range of millivolts. The short circuit current was of the order of microamperes. The net flux of chloride was directed to the mucosal side. The current-voltage relationship was linear in the range of the ±30 microamperes. The measured functions were stable during the study only when the ambient temperature was about 10°C. (16 refs.)

120824 Impact of recruitment order on electrode design for neural prosthetics of skeletal muscle. J.S.Petrofsky (Dept. of Engng. & Physiology, Wright State Univ., Dayton, OH, USA), C.A.Phillips.
Am. J. Phys. Med. (USA), vol.60, no.5, p.243-53 (Oct. 1981). [received: Sept. 1983]
The impact of recruitment order on isometric and dynamic endurance was examined in the cat to determine the optimal pattern of recruitment which can be used to stimulate skeletal muscle. The experiments were conducted on the medial gastrocnemius muscle of the cat, a muscle with a mixed composition of muscle fibers (both fast twitch and slow twitch motor units). Two orders of motor unit recruitment were examined, recruitment from the fastest to slowest motor units and recruitment from the slowest to fastest motor units. The results of these experiments showed that while recruitment order had little effect on the endurance for dynamic exercise, the endurance for isometric exercise at low tensions was less with recruitment proceeding from the fastest to slowest rather than the slowest to fastest motor units. The implications of these results in electrode design are discussed. (39 refs.)

120825 Human factors and behavioral science: central control of movement timing. D.A.Rosenbaum (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.6, pt.3, p.1647-57 (July-Aug. 1983).
Examines the mechanisms of movement timing. Of necessity, the experiment that has been reported involved a restricted type of movement, namely simple finger sequences. Yet the experiment appears to have fairly broad theoretical importance for our understanding of how movements are timed. In particular, the experiment suggests that even when peripheral feedback is available, central programs play a controlling role in movement timing. (21 refs.)

120826 Change in the mechanical parameters as a possible mode of information processing by the neurone. Ye.A.Liberman, S.V.Minina, N.Ye.Shklovskii-Kordi, M.Conrad (Inst. of Problems of Information Transmission, Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.906-15 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.863-70 (1982). [received: Sept. 1983]
Depolarization of the membrane of the neurone induced by cyclic AMP was detected both by the method of ionophoresis and injection under pressure. Inflation of the neurone at the moment of injecting various substances by pressure caused depolarization of the membrane with much the same time course as the effect of cyclic nucleotides. The influence of cAMP with use of pressure was detected with inhibitors of phosphodiesterase. The similarity of the effects of the cyclic nucleotides and mechanical stimulation of the neurone suggest that in both cases the action is mediated by a mechanical system consisting of a microskeleton and micromuscles. The hypothesis is advanced that the intraneurone information processing is carried out with such an analogue system. (33 refs.)

120827 Mechanism of the origin of the helical waves in active media associated with the phenomenon of critical curvature [bioelectrical application]. A.V.Panfilov, A.M.Pertsov (Inst. of Biological Phys., Pushchino, USSR).
Biophysics (GB), vol.27, no.5, p.931-4 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.886-9 (1982). [received: Sept. 1983]
Computer study of a two-dimensional active medium described by Fitz-Hugh and Nagumo equations has revealed a new mechanism of the origin of helical waves. It is shown that when the wave bends round the partition on which the Neumann boundary conditions are set it breaks away from the boundary with formation of a break of the front which then evolves into a helix. The effect is observed when the curvature of the break is close to the critical value for the given medium. (8 refs.)

120828 Mechanism of the origin of the first extrasystole in short-lived atrail arrhythmia. A.B.Medvinskii, A.M.Pertsov (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.5, p.940-4 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.895-9 (1982). [received: Sept. 1983]
Using the mapping method (at 80-150 points) on strips of the rabbit left atrium, the authors have studied the spread of excitation in arrhythmias induced by electrical stimulation in the vulnerable phase. The arrhythmias were initiated in normal conditions and against a background of acetylcholine (0.2 mg/l.). The electrical activity was recorded with surface electrodes. It was shown that the first extrasystolic wave, as a rule, is due to the appearance of one or more point or ring-like sources of excitation on the surface of the myocardium. Continuous circulation of the excitation wave over the surface of the heart tissue was absent. The possible mechanisms of the origin of such sources are discussed. Circulations of excitation deep in the myocardium (intramural return) are regarded as the most probable mechanism. (12 refs.)

120829 Refractoriness of heart tissue with fall in the fast Na influx. Comparison of atrium and ventricle. A.K.Grenader, V.M.Ponomareva, G.G.Zurabishvili, B.N.Basiyev (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.5, p.957-60 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.911-14 (1982). [received: Sept. 1983]
On strips of the left atrium and the wall of the right ventrical of the rabbit heart the value of the fast Na influx (I_{Na}) was reduced by replacing NaCl in the perfusion solution by sucrose and also by the action of low concentrations of anti-arrhythmia blockers of I_{Na} (lidocaine, diphenylhydantoin and ethmosine). It is shown that fall in I_{Na} increases the refractoriness (R) of the atrium and has little effect on R of the ventricle. Further fall in I_{Na} also increases R of the ventricle. It is postulated that rise in R with fall in I_{Na} is one of the mechanisms of the raised sensitivity of ischaemia-damaged tissue of the ventricle of the heart to anti-arrhythmia blockers of I_{Na}. (11 refs.)

120830 Computer analysis of prolongation of cardiac action potential duration. T.Ban (Dept. of Pharmacology, Yamaguchi Univ., Yamaguchi, Japan).
Comput. & Biomed. Res. (USA), vol.16, no.5, p.403-13 (Oct. 1983).
Using Beeler and Reuter's mathematical model of action potential in myocardial fibers, a similar extent of prolongation of action potential duration at -60 mV (APD_{-60}) was produced at the infinite interval of stimulation by altering parameter values for slow inward current (i_s) time-independent (i_{k1}) and time-dependent (i_{x1}) outward currents. Among five types of prolongation of APD_{-60} thus produced, the plateau height is high in two types at this interval, but in three at a shorter interval. The degree of prolongation varies between these five types at this shorter interval. The stimulus interval-action potential duration (interval-duration) relation curves reflect changes in time-dependent parameters of these currents. Thus various types of APD prolongation may be distinguished from each other by the different behavior of action potentials at low and high frequencies of stimulation. i_{x1} increases by 40-fold at the moment of the maximum rate of depolarization at an interval of 330 msec, but is still negligibly small as compared with sodium current. (15 refs.)

120831 Computer simulation of the cardiac conduction system. M.Malik, T.Cochrane, A.J.Camm (Dept. of Cardiology, St. Bartholomew's Hospital, London, England).
Comput. & Biomed. Res. (USA), vol.16, no.5, p.454-68 (Oct. 1983).
A discrete computer model simulating the operation of the cardiac impulse transmission apparatus and the electropotential changes of the heart musculature has been developed on a NORD-100 minicomputer. The model is written in NORD-FORTRAN and allows description of practically all basic pathologies of the transmission apparatus. A simulated ECG curve is produced in each case. The current version of the model is especially suited for studies of heart rhythms. Pacemaker descriptions (of most important pacemaker types) have been introduced into the model and the computer computations make it possible to assess the effects of different pacemaker modes under different pathological situations. The principle on which the model is based is described and the authors show concisely several examples in the form of simulated ECG records. (6 refs.)

120832 Effects of static muscular contraction on impulse activity of groups III and IV afferents in cats. M.P.Kaufman, J.C.Longhurst, K.J.Rybicki, J.H.Wallach, J.H.Mitchell (Depts. of Physiology & Internal Medicine, Univ. of Texas Health Sci. Center, Dallas, TX, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.105-12 (July 1983).
Static contraction of the hindlimb muscles, induced by electrical stimulation of the ventral roots, reflexly increases arterial blood pressure and heart rate. Although stimulation of groups III and IV muscle afferents is believed to cause these reflex increases, the response of these afferents to a level of static contraction that increases arterial pressure have not yet been determined. Therfore, in barbiturate-anesthetized cats, afferent impulses arising from endings in the gastrocnemius muscle were recorded from the L_7 or S_1 dorsal roots, while the cut peripheral end of the L_7 ventral root was stimulated. Results suggest that, although both groups III and IV muscle afferents contribute to the reflex cardiovascular increases evoked by static exercise, group III fibers were likely to be stimulated by the mechanical effects of muscular contraction, whereas at least some group IV fibers were likely to be stimulated by the metabolic products of muscular contraction. (24 refs.)

120833 Factors determining the frequency content of the electromyogram. H.Kranz, A.M.Williams, J.Cassell, D.J.Caddy, R.B.Silberstein (Dept. of Neurology & Clinical Neurophysiology, Alfred Hospital, Melbourne, Victoria, Australia).
J. Appl. Physiol. (USA), vol.55, no.2, p.392-9 (Aug. 1983).
The contribution of central and peripheral factors to the frequency content of the electromyogram was examined in 10 subjects performing maximal 45-s contractions of thenar muscles. The median frequencies (F_m) of surface-recorded electromyograms and compound action potentials were similar early ($P>0.6$) and late ($P>0.5$) in the contractions. There was a mean decrease in the F_m during contraction of 39% for electromyograms and 35% for compound potentials ($P>0.1$). The F_m of electromyograms increased 11% ($P<0.02$) in only the 1st s of contraction as force was raised from 25 to 100% of maximum. Only one of five subjects showed evidence of increasing synchronization of motor unit discharge during contraction. There was no evidence that delay or dispersion of action potential propagation in terminal nerve fibers or at the neuromuscular junction had a significant effect on frequency content. The findings indicated that the spectral content of muscle electrical activity, and its shift during contraction, primarily reflects intrinsic muscle properties. (33 refs.)

120834 A model for the nerve impulse propagation using two first-order differential equations. K.Rajagopal (Dept. of Phys., Bharathidasan Univ., Tamilnadu, India).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.77-8 (3 Oct. 1983).
A simple model is proposed for the nerve impulse propagation using two first-order differential equations, which are found to be completely integrable. The solutions have been obtained explicitly in terms of elliptic functions to the propagating waves and pulses. This model also predicts linearity of the frequency-current relationships. (7 refs.)

120835 Patch-recorded single-channel currents of the purified and reconstituted Torpedo acetylcholine receptor. D.W.Tank (Dept. of Phys., Cornell Univ., Ithaca, NY, USA), R.L.Huganir, P.Greengard, W.W.Webb.
Proc. Natl. Acad. Sci. USA, vol.80, no.16, p.5129-33 (Aug. 1983).
Small unilamellar vesicles containing purified and reconstituted nicotinic acetychlorine receptors from Torpedo electroplax have been fused by a simple freeze-thaw procedure to form large liposomes. Giga-seal patch-recording techniques were used to form isolated patches of loposome-membrane and to measure single-channel properties of the reconstituted receptor-ion channel complex. The observed properties are quantitatively similar to those reported for vertebrate muscle nicotinic acetylcholine receptor species recorded in situ. The results demonstrate that the pentameric complex consisting of the $\alpha_2\beta\gamma\delta$ subunits is fully functional. The methods used in these experiments should be useful in studying the effects of chemical alterations on the properties of acetycholine receptor channels as well as other types of purified and reconstituted ion channels. (20 refs.)

120836 Burst discharge in mammalian neuroendocrine cells involves an intrinsic regenerative mechanism. R.D.Andew, F.E.Dudek (Dept. of Physiology, Tulane Univ. School of Medicine, New Orlenas, LA, USA).
Science (USA), vol.221, no.4615, p.1050-2 (9 Sept. 1983).
Intracellular recordings from mammalian neuroendocrine cells showed that steady, injected currents can modify and block periodic spike bursts previously associated with increased neurohormone release. Spike afterpotentials could sum to form plateau potentials, which generated bursts and did not depend on axonal conduction or chemical synapses. Therefore, bursting involves a spike-dependent, positive-feedback mechanism endogenous to single neuroendocrine cells. (22 refs.)

120837 Immunocytochemically identified vasopressin neurons in culture show slow, calcium-dependent electrical responses. D.T.Theodosis, P.Legendre, J.D.Vincent (Unite de Recherches de Neurobiologie des Comportements, INSERM, Bordeaux, France).
Science (USA), vol.221, no.4615, p.1052-4 (9 Sept. 1983).
From morphological characterization and intracellular recordings, monolayer cultures derived from fetal mouse hypothalami were found to include functionally differential peptide neurons, a number of which appear to contain vasopressin. These cells exhibited particular patterns of slow, calcium-dependent membrane depolarizations, resembling in their periodicity and duration the phasic activity of vasopressin neurons recorded extracellularly in vivo. (11 refs.)

87.32 PHYSIOLOGICAL OPTICS, VISION

120838 How do sense organs make sense. S.L.Boersma (Engng. Consultant, N Beetslaan, Delft, Netherlands).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.10-14 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A sense organ is a nonlinear operator operating on an external field. It performs a dual task: a. Data reduction by many orders of magnitude. b. Making sense, that is producing individual-invariant data out of the raw stream. A Wigner distribution function is a suitable operator for both hearing and vision fields. In hearing it leads to frequency, tone, perception. In vision it produces ray directions. Now tactile, auditory and visual information fit together into a single perception spectrum. Relations are shown to exist between the specification of eye, ear and tactile sense. These relations hold for many species of animals, including insects. (5 refs.)

120839 A cascade model of the retinal nervous system. T.Hirose, I.Mizoshiri (Dept. of Electrical Engng., Ritsumeikan Univ., Kyoto, Japan).
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.40, p.57-65 (1981).
The paper concerns the frequency characteristics of the visual system. The spatial modulation transfer function (MTF), the temporal MTF and the spatio-temporal frequency characteristics of the visual system were measured. It is assumed that the retinal nervous system is linear and that spatial and temporal systems are independent of one another. The simplest cascade model of the retinal nervous system is proposed. The spatio-temporal responses and frequency characteristics of the cascade model are calculated and the lateral inhibition corresponding with the negative part of response is also yielded. (6 refs.)

120840 The effects of contact lens deformation on tear film pressure and thickness during motion of the lens towards the eye. H.D.Conway, M.W.Richman (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.47-9 (Feb. 1983). [received: Oct. 1983]
An analysis is made of the motion of a contact lens normal to the eye through a tear film. The eye is modeled as a rigid sphere and the lens as a deformable spherical cap. Graphs of pressure distribution and tear film thickness variations are obtained. It is found that the pressures are very markedly reduced and film thicknesses increased by decreasing the modulus of the lens materials. (6 refs.)

120841 Correlation and interferometric light scattering studies of the lens of the eye. P.N.Pusey, J.T.Randall, J.M.Vaughan (Royal Signals & Radar Establishment, Gt. Malvern, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.29-34 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Techniques of dynamic light scattering have been applied to biological lens material in recent years by a number of authors. The enhanced scattering due to cataract, leading to eventual opacity, has been described by two related models—one ascribing the phenomenon to aggregations of the globular crystallines and the other to a phase separation. The authors' observations of Brillouin scattering, and correlation studies of diluted material, indicate some degree of simple aggregation. However, work on natural and homogenised material (including human, bovine and fish lenses) shows very slow fluctuations which suggest more complex interactions. (10 refs.)

120842 The geometric and Fourier transform solutions for the object-image conjugated interference field of human retina in the visual acuity examination by laser interferometry. Dong Taihuo, Ma Changming (Optical Instruments Dept., Zhejiang Univ., Zhejiang, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.311-17
The LIRVA (laser interferometric retinal visual acuity) tester provides an effective means for the preoperation examination of cataracts. On the bases of theory and experiment, the authors suggest that the retinal interference pattern as seen by a cataractous patient is a reconstructed image of the tester's initial interference field which results after two optical transforms by the imaging optical system and eye, and is not simply formed by the two coherent spot-sources which are entered and sited at the eye nodal point. (16 refs.)

87.32E Physiology of the eye; nerve structure and function

120843 Dependence of the simple motor reaction time on the luminance in the dark adaptation state. P.Jaskowski, A.Pilawski (Dept. of Biophys., School of Medicine, Poznan, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.3, p.157-61 (May-June 1982). [received: Sept. 1983]
In a group of 16 persons with normal vision the simple motor reaction time to visual stimuli was measured depending on the luminance in the dark adaptation state. It was found that this relation was well described by a power function. The exponent was not dependent on the individual subject and was equal to $\beta=0.29\pm0.02$. It was found that the value of s for a single subject, who took part in this type of experiment for the first time, could be measured with a standard deviation of 0.10. (13 refs.)

120844 Dependence of simple motor reaction time on luminance in various adaptation states. P.Jaskowski (Dept. of Biophys., Medical Acad., Poznan, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.3, p.163-8 (May-June 1982). [received: Sept. 1983]
For different levels of eye adaptation to light the reaction to visual stimuli depending on the luminance was measured. The results proved to be described by the relationship $L=L_\infty+k(I-I_0)^{-\beta}$ (where L—reaction time; I—luminance of the stimulus; L_∞—reaction time, if $I\rightarrow\infty$; β, k are constants). The parameters β, k and I_0 changed parallelly with luminance changes of the adapting field. In particular, I_0 behaved as the threshold luminance at a given background luminance. It was found that there exists a constant C, not depending on the level of adaptation. (6 refs.)

120845 Space-frequency characteristics of the receptive fields of the cat visual cortex in conditions of homogeneous and inhomogeneous backgrounds. V.D.Glezer, V.Ye.Gauzel'man, V.M.Bondarko, T.A.Shcherbach (Pavlov Inst. of Physiology, Acad. of Sci., Leningrad, USSR).
Biophysics (GB), vol.27, no.5, p.915-19 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.871-4 (1982). [received: Sept. 1983]
The authors have studied the space-frequency characteristics of the cortical receptive fields obtained on a sinusoidal lattice after their presentation against a background consisting of the same orthogonally oriented lattices and against a uniform background. The results correspond to notions on linear independence in orientation for the receptive field acting as a filter of spatial frequency. (10 refs.)

120846 Model interpretation of visual-vestibular interaction in patients with labyrinthine and cerebellar pathologies. A.Buizza, R.Schmid (Dipartimento di Informatica e Sistemistica, Univ. di Pavia, Pavia, Italy).
Biol. Cybern. (Germany), vol.47, no.3, p.203-11 (1983).
Oculomotor responses to combined optokinetic and vestibular stimulations in labyrinthine and cerebellar defective patients are discussed in terms of parametric changes in a model describing the interaction between the vestibulo-ocular reflex (VOR) and the optokinetic reflux (OKR). The model can be used to define a set of parameters giving an estimate of the state of the system subserving VOR-OKR interaction in the examined patients. The model is also shown to be a powerful tool to assess the validity and the diagnostic significance of the procedures used to test VOR-OKR interaction. (27 refs.)

120847 A functional model of the wiring of the simple cells of visual cortex. D.E.Nielsen (Inst. of Neurophysiology, Panum Inst., Copenhagen, Denmark).
Biol. Cybern. (Germany), vol.47, no.3, p.213-22 (1983).
A computer model of the simple cells in the mammalian visual cortex is constructed. The model cells received inputs from a great number of isopolar centre/surround cells assumed to be located in the lateral geniculate nucleus (LGN). In all the situations tested, the responses of the model cells corresponded qualitatively very well to those of living cells. It was seen that the same writing mechanism was able to account for orientation selectivity, spatial frequency filtering, various phase relationships between stimulus and response, subfield orientational selectivity, and slight end-inhibition. Furthermore, the receptive fields of the model simple cells closely resemble Gabor functions. (16 refs.)

120848 The mass receptor potential in the study of enzymatic processes in the vertebrate retinal photoreceptors. S.Hemila.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.50-7 (1983).
The DC amplified transretinal voltage of the aspartate-treated retina is useful in the study of excitation and adaptation of the rod photoreceptor, but secondary currents brought about by rod excitation have to be taken into account. Experiments using this technique are presented, showing that phosphodiesterase inhibitors cause large transient increases in the sodium 'dark current'. This indicates that cyclic GMP opens more sodium channels in the rod plasma membrane. (23 refs.)

120849 Laser speckle technique for the visualization of retinal blood flow. J.D.Briers, A.F.Fercher (Univ. of Essen, Fachbereich Phys., Essen, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.22-8 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A single-exposure laser speckle photography technique is being developed for the visualization of velocity distributions in flow fields. Of particular interest is its application to the in vivo mapping of retinal blood flow. The basic principles of the technique are outlined, together with a mathematical model and some experimental results using rotating diffusers. Some preliminary results from a human retina are also presented. (15 refs.)

120850 A cholinergic-sensitive channel in the cat visual system tuned to low spatial frequencies. T.H.Harding, R.W.Wiley, A.W.Kirby (US Army Aeromedical Res. Lab., Fort Rucker, AL, USA).
Science (USA), vol.221, no.4615, p.1076-8 (9 Sept. 1983).
Visually evoked responses to counterphased gratings were recorded from the cat visual cortex before and after physostigmine administration. Physostigmine markedly reduced the responses to low spatial frequencies, but minimally affected the response to high frequencies. This effect is considered cholinergic since it could be reversed by atropine. These results support at least a two-channel model of spatial frequency responsivity. (18 refs.)

87.32N Colour detection; adaptation and discrimination

120851 Colour vision in animals. G.H.Jacobs (Univ. of California, Santa Barbara, CA, USA).
Endeavour New Ser. (GB), vol.7, no.3, p.137-40 (1983).
The nature of human colour vision has been the subject of much research, and is generally well understood. By contrast, relatively little is known about colour vision in animals. This partly reflects experimental problems for it is difficult to know whether an animal is responding to a colour cue or to some other external stimulus. This article reviews current knowledge about colour vision in vertebrates. (9 refs.)

120852 Recent advances in retinex theory and some implications for cortical computations: color vision and the natural image. E.H.Land (Rowland Inst. for Sci., Cambridge, MA, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.16, p.5163-9 (Aug. 1983).
Discusses the quantitative procedures used by the author. He uses a laboratory display called a Mondrian which utilises about 100 colored papers. He concludes that retinex theory is a powerful tool that explains many of the basic phenomena of color vision. It predicts many others. (12 refs.)

87.32S Psychophysics of vision, visual perception, binocular vision

120853 Human factors and behavioural science: textons, the fundamental elements in preattentive vision and perception of textures. B.Julesz, J.R.Bergen (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.6, pt.3, p.1619-45 (July-Aug. 1983).
Gives an overview of some insights into the workings of the human visual system gained during two decades of research at Bell Laboratories, and culminating in the discovery of a few local conspicuous features that the authors call textons. Textons appear to be the basic units of preattentive texture perception, when textures are viewed in a quick glance with no further effort or analysis. Although this article goes beyond texture perception into preattentive vision in general, studies of texture discrimination led to the basic insights presented and provide excellent demonstrations of the main findings. The authors propose a novel theory of vision in which the preattentive visual system inspects a large portion of the visual field in parallel and detects only density differences in textons. It then directs focal attention to these loci of texton differences for detailed scrutiny. (28 refs.)

120854 Human factors and behavioral science: experiments on quantitative judgments of graphs and maps. W.S.Cleveland, C.S.Harris, R.McGill (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.6, pt.3, p.1659-74 (July-Aug. 1983).
Behavioral studies are essential for devising guidelines for effective communication of quantitative information from graphs. Three experiments in which subjects made quantitative judgments from three different kinds of graphs lead to several recommendations: use pastel rather than highly saturated colors on statistical maps; standardize the point cloud size relative to the frame on a scatterplot; scale circles by making the circle area proportional the the variable represented, but expect widely varying judgments of the areas. (21 refs.)

120855 Two spatio-temporal filters in human vision. I. Temporal and spatial frequency response characteristics. I.E.Holliday (Dept. of Phys., Imperial Coll. of Sci. & Technol. London, London, England), K.H.Ruddock.
Biol. Cybern. (Germany), vol.47, no.3, p.173-90 (1983).
Visual detection of stimulus movement requires information about changes in both the positional and temporal co-ordinates of the retinal image. Both spatial and temporal frequency response characteristics are investigated. Two spatio-temporal filters, ST 1 and ST 2 are reviewed. It is shown that the ST 2 responses can be obtained by combining ST 1 responses and a network incorporating the two filters is presented. Other similar psychophysical studies which imply the activity of two spatio-temporal filters are also reviewed. (41 refs.)

120856 Two spatio-temporal filters in human vision. II. Selective modification in amblyopia, Albinism, and hemianopia. A.R.Grounds, I.E.Holliday, K.H.Ruddock (Imperial Coll. of Sci. & Technol. London, London, England).
Biol. Cybern. (Germany), vol.47, no.3, p.191-201 (1983).
For pt.I see ibid., vol.47, no.3, p.173 (1983). The psychophysical methods described in part I are used. Data are given for 19 ambloyopes, an albino and a hemianope, and comparison data are also given for a number of subjects with normal vision. The results are displayed graphically to show the amount of deviation from normal behaviour. The results are discussed. (17 refs.)

120857 On seeing reddish green and yellowish blue. H.D.Crane, T.P.Piantanida (Visual Sci. Program, SRI Internat., Menlo Park, CA, USA).
Science (USA), vol.221, no.4615, p.1078-80 (9 Sept. 1983).
Four color names—red, yellow, green, and blue—can be used singly or combined in pairs to describe all other colors. Orange, for example, can be described as a reddish yellow, cyan as a bluish green and purple as a reddish blue. Some dyadic color names (such as reddish green and bluish yellow) describe colors that are not normally realizable. By stabilizing the retinal image of the boundary between a pair of red and green stripes (or a pair of yellow and blue stripes) but not their outer edges, however, the entire region can be perceived simultaneously as both red and green (or yellow and blue). (12 refs.)

120858 Employing properties of the human visual system for image segmentation. C.-E.Liedtke, W.Geuen, D.Wermser (Inst. fur Theor. Nachrichtentech., Univ. Hannover, Hannover, Germany).
Proceedings of the 3rd Scandinavian Conference on Image Analysis, Copenhagen, Denmark, 12-14 July 1983 (Lund, Sweden: Studentlitteratur 1983), p.146-51
One has become used to the fact that the information processing of digital computers is so much superior to that of human beings because of the digital computers precision of data storage and retrieval, its speed, its working in higher dimensions and its ability to perform complicated mathematical operations. This is almost opposite in image processing. While human viewers can easily find contours, differentiate textures, detect and track objects, perceive depth and analyse with ease image contents, present computer based image processing systems perform rather slow and show very limited capabilities. Because of this lack the authors approach to image analysis, especially image segmentation, is to study properties of the human visual system and perception in order to arrive at better algorithms and new concepts for the solution of specific problems in image processing. Results of some of the efforts are presented namely in contour detection, texture analysis, and knowledge representation to be used for the segmentation of natural images. (no refs.)

120859 Image coding based on human vision system properties for optimal reduction of redundancy. A.Ikonomopoulos, M.Kocher, M.Kunt (Lab. de Traitment des Signaux, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
Proceedings of the 3rd Scandinavian Conference on Image Analysis, Copenhagen, Denmark, 12-14 July 1983 (Lund, Sweden: Studentlitteratur 1983), p.216-21
Presents two image coding techniques based on the physiological observation that mammalian visual systems detect and process edge information by special mechanisms. One technique operates in the frequency domain by considering an image as the sum of a low frequency component, in a certain sense representing regions of uniform grey level, and many high frequency components corresponding to edges whose directions fall into limited intervals of angular variation. The second proceeds in the spatial domain by transforming a pixel-composed image into a region composed one, where the region boundaries represent the contour information and the interior pixels the texture information. Experimental results obtained from the above methods appear to be interesting and promising for both high rate data compression and good image quality. (5 refs.)

87.34 AUDITION

120860 Spatial cross-correlation: a proposed mechanism for acoustic pitch perception. G.E.Loeb (Nat. Inst. of Neurological & Communicative Disorders & Stroke, Bethesda, MD, US), M.W.White, M.M.Merzenich.
Biol. Cybern. (Germany), vol.47, no.3, p.149-63 (1983).
A new class of model processes for the extraction of spectral information from the neural representation of acoustic signals is proposed. The detection of synchronicity between two phase-locked signals derived from sources spaced a finite distance apart on the basilar membrane can be used to extract frequency from the spatiotemporal pattern of basilar membrane motion. One particular model of the process, invoking the binaurally sensitive cells of the medial superior olive as the critical detecting elements, has properties which are useful in accounting for certain complex binaural psychophysical observations. (85 refs.)

120861 Normal values of human tympanograms. Rao Yu-an, Yang Qiong-hua, Liang Zhi-an (Shanghai Inst. of Physiology, Acad. Sinica, Shanghai, China).
Acta Acust. (China), vol.8, no.3, p.140-6 (May 1983). In Chinese. [received: Oct. 1983]
Acoustic compliance was measured and calculated on tympanograms taken from 160-171 otologically normal human ears with the Middle-ear-function-measuring Apparatus, the test frequency being 300 Hz. The averaged maximum compliance was found to be 1.16 ml at zero ear-canal pressure (C_0), and 1.29 ml at the point where the pressure in the ear canal equaled that in the tympanic cavity (C_e). The relative compliance of the tympanometry (amplitude of the tympanogram) was 0.65 ml on average, but the individual difference is quite large, varying from the smallest 0.25 ml to the largest 1.61 ml. For the majority (96.1%) of the tested ears, the pressure in the tympanic cavity, as shown by the position of the peak of individual tympanograms, did not exceed ±50 mm H_2O. A new term of compliance ratio (*CR*) is introduced as a measurable parameter to express the gradient of compliance change which is of considerable importance in clinical tympanogram interpretation. *CR* is defined as $\Delta C_{\Delta P}/\Delta C_{200}$ where ΔC_{200} is the overall amplitude of a tympanogram and $\Delta C_{\Delta P}$ is the compliance shift from the peak to a certain point corresponding to a ΔP pressure change. It is proposed to take ±50 and ±100 mm H_2O for ΔP in routine compliance ratio measurement and comparison. *CR* is approximately 0.5 when ΔP is ±50 mm H_2O. (9 refs.)

120862 Auditory illusions, handedness and the spatial environment. D.Deutsch (Dept. of Psychology, Univ. of California, San Diego, La Jolla, CA, USA).
J. Audio Eng. Soc. (USA), vol.31, no.9, p.607-18 (Sept. 1983).
A number of paradoxical illusions occur when two streams of sound emanate simultaneously from different regions of space. Right-handers and left-handers differ statistically in terms of the illusory percepts obtained. The bases for these illusions are examined, and their implications are discussed. (23 refs.)

120863 Auditory illusions and their relation to mechanisms normally enhancing accuracy of perception. R.M.Warren (Dept. of Psychology, Univ. of Wisconsin, Milwaukee, WI, USA).
J. Audio Eng. Soc. (USA), vol.31, no.9, p.623-9 (Sept. 1983).
Some auditory illusions and confusions are discussed, including perceptual restoration of masked sounds (temporal induction), the loss of lateralization of a monaural signal when accompanied by contralateral noise (contralateral induction), and illusory changes in repeated words (verbal transformations). Each of these illusions seems to be caused by processes which act to enhance the accuracy of perception in the noisy environments encountered during everyday life. (21 refs.)

120864 Pitch segregation by interaural phase, by momentary amplitude disparity, and by monaural phase. M.Kubovy, J.E.Daniel (Dept. of Psychology, Rutgers-State Univ. of New Jersey, New Brunswick, NJ, USA).
J. Audio Eng. Soc. (USA), vol.31, no.9, p.630-5 (Sept. 1983).
Pitch segregation is an example of spontaneous auditory perceptual grouping in which one component of a complex is perceptually enhanced, or several are enhanced in turn, forming a tune or scale. Three component manipulations are discussed which produce pitch segregation by (1) altering the apparent location of the component (interaural time disparity); (2) briefly reducing and then restoring the amplitude of the component (momentary amplitude dispar-

ity); or (3) phase shifting one component of a monaural harmonic series (monaural phase disparity). (9 refs.)

120865 Demonstrations of circular components of pitch. R.N.Shepard (Dept. of Psychology, Stanford Univ., Stanford, CA, USA).
J. Audio Eng. Soc. (USA), vol.31, no.9, p.641-9 (Sept. 1983).
Pitch is usually thought of as a one-dimensional psychological attribute corresponding to the one-dimensional physical variable of frequency. However, complex tones can be continuously varied between pitches along at least three different dimensions: (1) a rectilinear dimension of height, (2) a circular dimension of chroma, and (3) a second circular dimension of musical fifths. Accompanying sound demonstrations illustrate each of these three variations including illusions in which a tone that is cyclically shifted around the chroma circle seems to go ever higher in pitch, and in which a tone that is simultaneously shifted in opposite directions in height and chroma seems always to be rising in pitch but is clearly lower at the end than at the beginning. (36 refs.)

120866 Influence of posture on the spatial localization of sound. J.R.Lackner (Dept. of Psychology, Brandeis Univ., Waltham, MA, USA).
J. Audio Eng. Soc. (USA), vol.31, no.9, p.650-61 (Sept. 1983).
The perceptual localization of sound often is thought to depend solely on the pattern of auditory cues at the ears. Evidence is presented that the computation of auditory direction also involves nonauditory information from visual, vestibular, tactile, and proprioceptive sources concerning the spatial configuration of the entire body. Likewise, auditory stimulation can influence the apparent orientation of the body. (25 refs.)

120867 Effect of tinnitus masker noise on speech discrimination in quiet and two noise backgrounds. J.B.Spitzer (Veterans Administration Medical Center, West Haven, CT, USA), B.A.Goldstein, L.G.Salzbrenner, G.Mueller.
Scand. Audiol. (Sweden), vol.12, no.3, p.197-200 (1983).
Use of masking devices is achieving recognition as a means of providing tinnitus relief. While palliative results have been described, possible disruptive consequences have not yet received attention. The present study examined the effects of tinnitus masker noise on speech intelligibility. Twenty young normals listened to NU-6 word lists presented in sound field in quiet white noise, and cocktail party noise backgrounds (S/N=0 dB) with and without a tinnitus masker. Although there was little impairment while wearing the masker in quiet, substantial discrimination loss was observed in the two noise backgrounds. The potential disruption in communication function while wearing a masking device is discussed. (9 refs.)

120868 Latencies of ABR (waves III and V) to binaural clicks: effects of interaural time and intensity differences. H.J.Rosenhamer, C.Holmkvist (Dept. of Audiology, Stockholm, Sweden).
Scand. Audiol. (Sweden), vol.12, no.3, p.201-7 (1983).
Auditory brainstem responses to monoaural clicks and to binaural clicks delivered with interaural time differences of 0.5 and 1 ms (delayed clicks in left ear) and interaural intensity differences (right ear minus left ear) of 0, ±10, ±20, and ±30 dB were recorded bilaterally in 7 normal subjects. Latencies of wave III and wave V were studied as functions of click intensity difference for each of the two time-of-onset differences. As the intensity difference was gradually varied from +30 to −30 dB, the latencies were seen to shift (with constant III-V interval) from those of a monaural right-ear (non-delayed clicks) response to those of a monaural left-ear (delayed clicks) response by 0.5 and 1 ms. In all subjects this shift occurred in the 20-dB interval between equal intensity and 20-dB lagging-click dominance, and almost always most of the shift took place in either of the two 10-dB subintervals. Occasionally double-peaked waves appeared in the 20 dB-interval. Binaural ABRs may become useful for diagnosis in patients with signs of brainstem disorder but the normal-hearing and normal audiometric findings including monaural ABR, as such patients have been found to shift their latencies more slowly with varying interaural intensity difference. 120869 Cranial and phrenic nerve responses to changes in systemic blood pressure. J.A.Salamone, K.P.Strohl, D.M.Weiner, J.Mitra, N.S.Cherniack (Dept. of Medicine, Cleveland Metropolitan General Hospital, Univ. Hospitals of Cleveland, Cleveland, OH, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.61-8 (July 1983).
Fluctuations in blood pressure could result in a change in respiratory neural output not only to chest wall but also to upper airway muscles. The authors compared the effects of changing systemic blood pressure on the activities of the hypoglossal, recurrent laryngeal, and phrenic nerves in eight paralyzed anesthetized dogs ventilated with 100% O_2, room air, or 7% CO_2 in 93% O_2. During steady-state inhalation of each gas, arterial blood pressure was abruptly lowered by inflating a balloon in the inferior vena cava and was raised by similarly obstructing the descending aorta or by clamping both common carotid arteries. Measurements of peak nerve activity from the moving time average were made for all three nerves at each level of chemical drive before and for the first three-five breaths coincident with the maximal changes in blood pressure. The findings suggest that reflexes initiated by changing baroreceptor activity can result in an uneven distribution of respiratory drive to upper airway and chest wall muscles. (20 refs.)

120870 Recovery of normal topography in the somatosensory cortex of monkeys after nerve crush and regeneration. J.T.Wall, D.J.Felleman, J.H.Kaas.
Science (USA), vol.221, no.4612, p.771-3 (19 Aug. 1983).
After median nerve fibers to glabrous skin on the hands of monkeys were crushed and allowed to regenerate, normal topographical organization was recovered in the representation of the hand in primary somatosensory cortex. Similar recovery of normal cortical organization may underlie the sensory restoration that usually follows nerve crush injury in humans. (9 refs.)

120871 Adaptive changes in the vestibulo-ocular reflex in flatfish are achieved by reorganization of central nervous pathways. W.Graf, R.Baker.
Science (USA), vol.221, no.4612, p.777-9 (19 Aug. 1983).
Flatfish provide a natural model for the study of adaptive changes in the vestibulo-ocular reflex system. During metamorphosis their vestibular and oculomotor coordinate systems undergo a 90° relative displacement. As a result, during swimming movements different types of compensatory eye movements are produced before and after metamorphosis by the same vestibular stimulation. Intracellular staining of central nervous connections in the flatfish with horseradish peroxidase revealed that in postmetamorphic fish secondary horizontal semicircular canal neurons contact vertical eye muscle motoneuron pools on both sides of the brain via pathways that are absent in all other vertebrates studied. (18 refs.)

120872 Ventral posterior thalamic neurons differentially responsive to noxious stimulation of the awake monkey. K.L.Casey, T.J.Morrow (Neurology Res. Labs., Veterans Administration Medical Center, Ann Arbor, MI, USA).
Science (USA), vol.221, no.4611, p.675-7 (12 Aug. 1983).
Of 76 cutaneously activated neurons recorded from the ventral posterior thalamus of awake, behaving monkeys, nine were weakly excited by innocuous skin stimulation and responsed maximally only when noxious mechanical cutaneous stimuli were developed within small, contralateral receptive fields. These results show that neurons capable of encoding the spatial and temporal features of noxious stimuli are located in the ventral posterior thalamus of the awake primate. (19 refs.)

120873 Influence of torque and limb speed on power production in isokinetic exercise. L.R.Osternig (Dept. of Phys. Education, Univ. of Oregon, Eugene, OR, USA), J.Hamill, J.A.Sawhill, B.T.Bates.
Am. J. Phys. Med. (USA), vol.62, no.4, p.163-71 (Aug. 1983).
Power has not often been the focus of attention in the determination of specific loads and velocities for rehabilitative and conditioning exercises. The purpose of this study was to determine the relative influence of torque and limb speed on power production in isokinetic exercise. Voluntary maximum torque values from the quadriceps muscle groups of 10 male college athletes were recorded on an isokinetic dynamometer. Dynamic leg extensor torque and power from the preferred limb were measured at six joint positions through a range of 70-20° of knee flexion and at eight velocities ranging from 50-400°/sec. The data obtained suggested that rehabilitative and conditioning exercises at faster isokinetic speeds may be more effective than slower speeds for power production. Since the position at which peak torque occurs may vary with speed of motion, these data underscore the importance of analyzing maximal values at specific joint angles across speeds in addition to the peak values generated throughout a joint range. (12 refs.)

120874 Electrogoniometry of post-surgical knee bracing in running. K.M.Knutzen (Dept. of Phys. Education, Western Washington Univ., Bellingham, WA, USA), B.T.Bates, J.Hamill.
Am. J. Phys. Med. (USA), vol.62, no.4, p.172-81 (Aug. 1983).
The dynamic range of motion at the knee was compared for two knee braces worn during overground running. Six adult volunteers aged 22 to 28 were used as subjects. All subjects had a surgically repaired knee, a healthy contralateral knee, and were wearing the same type of derotation brace prescribed by their physician. Subjects ran through an experimental area at a slow running pace with the CARS-UBC electrogoniometer strapped to one limb. Three orthogonal potentiometers placed at the knee joint allowed the simultaneous collection of flexion-extension, inward and outward rotation, and varus-valgus motion parameters. Subjects completed five trials at each of four conditions; namely, healthy knee, surgically repaired knee, surgical knee fitted with an elastic support brace, and surgical knee fitted with a derotation brace. Results showed that the derotation brace had a general restraining effect on internal-external rotation of the surgically repaired knee. For all subjects, internal rotation was reduced by 22 percent and external rotation reduced by 31 percent. There was also an 11 percent reduction in the flexion-extension range of motion while subjects wore the derotation brace. The elastic support brace did not reduce any range of motion parameters. (11 refs.)

120875 The muscular blood flow in healthy persons of different age. O.V.Korkushko, K.G.Sarkisov, V.E.Fraifel'd.
Med. Radiol. (USSR), vol.28, no.9, p.39-42 (Sept. 1983). In Russian.
A study was made of the muscular blood flow at rest (MBFR) and in reactive hyperemia in 170 healthy persons using a method of local clearance with ^{133}Xe. The results of the study showed a regular decrease in the MBFR

and maximum muscular blood flow (MMBF) level in aging, the decrease rates of MMBF considerably prevailing over those of MBFR. In the age interval between 18-96 MBFR lessens by 24%, MMBF more than twice. The age-associated time course of MMBF is of a more complicated nature as compared to that of MBRF and indicates a considerable reduction of the functional reserves of the tissue blood flow in the skeletal muscles of middle-aged and old persons. The above data make it possible to outline MBFR rough standard values: for young persons—2.5-5.0 ml/100 g/min., for older persons—1.5-3.5 ml/100 g/min. (9 refs.)

120876 Pressures during retrograde pyelography. H.S.Thomsen (Univ. of Copenhagen, Herlev, Denmark).
Acta Radiol. Diagn. (Sweden), vol.24, no.2, p.171-5 (1983).
Model experiments were conducted to simulate the conditions of injection rate and pressure during retrograde pyelography. Pressures at the upper and lower end of a Ch. 5 and Ch. 6 ureteral catheter were determined with 30% and 45% sodium meglumine diatrizoate and water and with different needles allowing leakage of the injected medium from a reservoir at the upper end of the catheter. It is concluded that the pressure at the upper end of the catheter may be kept within physiologic range if (1) the contrast medium is injected slowly, (2) the contrast medium leaks back around the ureteral catheter into the bladder and (3) a contrast medium with a low viscosity is used. It is advisable to use a Ch. 5 ureteral catheter instead of a Ch. 6 for retrograde pyelography. (16 refs.)

120877 Relationship between length and strength in heart muscle. Electromechanical coupling on deformation of the myocardium. V.Ya.Izakov, Yu.L.Protsenko (Sverdlovsk Res. Inst. of Labour Hygiene & Occupational Diseases, Sverdlovsk, USSR).
Biophysics (GB), vol.27, no.5, p.925-31 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.880-5 (1982). [received: Sept. 1983]
The method of current clamping in a sucrose bridge on the myocardium of the frog atrium and ventricle and the rabbit papillary muscles has been used to study the effect of the initial length of the preparations on the phasic and tonic components of the mechanical response. It has been established that stretching shifts the curves current-strength against amplitude of mechanical response to the region of lower values of depolarizing current. The ratio of the phasic and tonic components depends on the initial length of the myocardium. It is assumed that the link between length and strength as well as change in the degree of overlap of the filaments of the contractile proteins is based on change in the membrane potential of the surface membrane of the myocytes and additional calcium activation. (16 refs.)

120878 An estimate of the stress-field in an osseous medium having a no-slip interface crack. J.C.Misra, V.V.T.N.Murty (Dept. of Maths., Indian Inst. of Technol., Kharagpur, India).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1075-86 (1983).
A study of the stress-field in the vicinity of a no-slip interface crack in an osseous medium is presented. The study is based on the use of a mathematical model concerning adhesive fracture mechanics at a bimaterial interface. The solution is motivated by problems in artificial human joints in which the artificial material forming the articulating surface is connected to bone by a polymeric material, e.g. polymethyl-methacrylate (PMMA). Linear viscoelasticity of bones (in conformity to experimental observations) is accounted for in the analysis. Starting with the differential operator representations of constitutive relations and using integral transform techniques, the problem is reduced to that of finding the solution of a set of coupled integral equations. Quantities of physical interest are obtained numerically by using experimentally determined values of various physical constants involved in the analysis. (13 refs.)

120879 Expiratory flow limitation. R.E.Hyatt (Dept. of Physiology & Biophys., Mayo Clinic & Mayo Found., Rochester, MN, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.1-7 (July 1983).
The first major advance in understanding expiratory flow limitation of the lungs came with the description of isovolume pressure-flow curves. These curves documented the existence of a volume-dependent limit to maximal expiratory flow and led directly to the description of the maximal expiratory flow-volume (MEFV) curve. Definitive modeling of flow limitation awaited the description of a localized mechanism that dominated the flow-limiting process. The phenomenon of wave speed limitation of flow was shown to apply to the airways and provided the needed localized mechanism. Using this concept and recent data on airway mechanics and the frictional losses in the flow, a computational model of the MEFV curve has been developed. Further progress will require modeling of inhomogeneous emptying in diseased lungs, perfecting noninvasive techniques of estimating pertinent airway characteristics, and improving techniques for increasing the signal-to-noise ratio in MEFV curves. (47 refs.)

120880 Force reserve of the diaphragm in patients with chronic obstructive pulmonary disease. F.Bellemare, A.Grassino (Notre Dame Hospital, Univ. of Montreal, Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.8-15 (July 1983).
The fatigue threshold of the human diaphragm in normal subjects corresponds to a transdiaphragmatic pressure (Pdi)-inspiratory time integral (TTdi) of about 15% of Pdi_{max}. The TTdi of resting ventilation was measured in 20 patients with chronic obstructive pulmonary disease (COPD) and ranged between 1 and 12% of Pdi_{max} (mean 5%). TTdi was significantly related to total airway resistance ($r=0.57$; $P<0.05$). It is concluded that (1) the force reserve of the diaphragm in COPD patients is decreased because of a decrease in Pdi_{max}; (2) the remaining force reserve of the diaphragm can be exhausted by even minor modifications in the breathing pattern; and (3) at a T_I/T_T (ratio of inspiratory time to total cycle duration) of 0.40 the COPD patients can increase their mean Pdi 3-fold before reaching a fatiguing pattern of breathing compared with 8-fold in normal subjects. (21 refs.)

120881 Parametric estimation of ventilation-perfusion ratio distributions. W.E.Stewart, S.M.Mastenbrook,Jr. (Dept. of Chem. Engng. & Preventive Medicine, Univ. of Wisconsin, Madison, WI, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.37-51 (July 1983).
Presents a model and rigorous statistical approach for recovery of ventilation-perfusion ratio (V/Q) distribution parameters from multiple inert gas elimination data. The authors model the lung as a parallel combination of shunt, dead space, and one to three log-normal distributions of gas exchange units. This model provides a natural set of parameters for characterizing V/Q distributions. The log-normal terms are adjustable to represent smooth or sharp peaks in the distribution. Since the peak locations and widths are explicit in the model, very few parameters are needed. The authors select and estimate the significant parameters of the model by use of standard statistical tests and constrained least squares. This method provides two major advances in V/Q distribution estimation: (1) it allows flexible pooling and statistical comparisons of multiple experiments, and (2) it simultaneously gives both point estimates and 95% probability intervals for the V/Q distribution parameters. The authors present results of their procedure for data from humans in health, stress, and pulmonary disease. A program package, VQPAR, in FORTRAN is available for implementing the procedure. (30 refs.)

120882 Cardiac output and skin blood flow in lean and obese individuals during exercise in the heat. N.B.Vroman, E.R.Buskirk, J.L.Hodgson (Lab. for Human Performance Res., Pennyslvania State Univ., University Park, PA, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.69-74 (July 1983).
Five obese (% body fat ≥27%) and five relatively lean (%body fat<20%) men performed upright exercise on a cycle ergometer at intensities of 30, 50, and 70% of their maximal aerobic power [$V(O_{2max})$ (ml.kg fat-free $wt.^{-1}.min^{-1}$] in both a thermoneutral [dry bulb temperature (T_{db})=22°C, wet bulb temperature (T_{wb})=14°C] and a hot (T_{db}=38°C, Twb=20°C) ambient environment. Cardiac output (Q) was measured by CO_2 rebreathing and forearm blood flow (FBF) was measured by venous occlusion plethysmography. Esophageal temperature (T_{es}) was measured by a thermocouple placed in the esophagus at approximately heart level, and mean skin temperature ($\bar{T}_{sk}$) was calculated from the average of thermocouple readings from six skin sites. It was concluded that body composition may alter the balance between the two opposing sets of cutaneous vascular reflexes (baroreceptor-induced vasoconstriction and thermoregulatory vasodilation) that regulate the competition for blood flow between the skin and working muscle during exercise in the heat. (28 refs.)

120883 Effect of granulocyte depletion on altered lung mechanics after endotoxemia in sheep. J.M.Hinson,Jr., A.A.Hutchison, M.L.Ogletree, K.L.Brigham, J.R.Snapper (Pulmonary Circulation Center, School of Medicine, Vanderbilt Univ., Nashville, TN, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.92-6 (July 1983).
To examine the role of circulating granulocytes in the airway changes caused by endotoxemia, the authors measured the response of chronically instrumented unanesthetized sheep to endotoxemia before and after granulocyte depletion with hydroxyurea. Granulocyte depletion did not affect the increases in mean pulmonary arterial pressure caused by endotoxin [peak pressure 59±8 cmH_2O±(SE) control, 51±8 cmH_2O granulocyte depleted]. However, the early (30-60 min after endotoxin) airway response to endotoxemia was markedly attenuated. Without granulocyte depletion, endotoxin caused dynamic compliance (Cdyn) to decrease to 41±10% of the base-line value and total lung resistance (RL) to increase to 283±61% of base line. When animals were granulocyte depleted, endotoxin decreased Cdyn to 69±6% ($P<0.05$) of base line and increased RL to 141±20% of base line ($P<0.05$). It is concluded that interaction of granulocytes with the lung contributes to the changes in lung mechanics observed following endotoxemia and that the early pulmonary hypertension and the early alterations in lung mechanics caused by endotoxemia are caused by separate processes. (27 refs.)

120884 Deposition of aerosol particles and flow resistance in mathematical and experimental airway models. C.S.Kim, L.K.Brown, G.G.Lewars, M.A.Sackner (Dept. of Medicine, Mount Sinai Medical Center, Miami Beach, FL, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.154-63 (July 1983).
Aerosol deposition and flow resistance in obstructed airways were determined from five mathematical and experimental airway models. The first three models were theoretical and based upon Weibel's (1963) symmetrical lung model with (1) uniform reduction of airway diameter in various groups of airway generations; (2) obstruction of a few major airways such that a severe uneven flow distibution occurs in the lung; (3) focal constriction of selected large airways. In model 3, an empirical formula was utilized to assess deposition and resistance in the constricted airways. The remaining two models were tested experimentally: (4) oscillation of a compliant wall in a straight tube and (5) two-phase gas-liquid flow utilizing human sputum in a rigid branching tube. In models 1, 2, and 3, airway resistance increased to a greater extent than did the increase of aerosol deposition except when small airways were obstructed in model 1. Here, the increase of aerosol deposition was slightly higher than the rise in airway resistance. A sharp increase of aerosol deposition with a minimal increase of flow resistance was demonstrated in models 4 and 5. These data indicate that aerosol deposition may be a more sensitive indicator of airway abnormalities than overall airway resistance in small airways obstruction, during oscillation of large and medium airway walls, and when excessive secretions within the airways move with a wave or slug motion. (35 refs.)

120885 Active and passive respiratory mechanics and control of breathing in kittens. W.A.Zin, D.Marlot, M.Bonora, N.M.Siafakas, H.Gautier, J.Milic-Emili (Meakins-Christie Labs., McGill Univ., Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.183-90 (July 1983).
In five spontaneously breathing kittens (12-13 days old), anesthetized with pentobarbital sodium, the authors measured the passive and active elastances and resistances of the respiratory system and the decay of inspiratory muscle pressure ($Pmus_I$) during expiration. When normalized for body weight (BW), passive resistance (Rrs.BW) was smaller in kittens than in adult cats, whereas passive elastance (Ers.BW) did not differ significantly. As a result, passive time constant ($\tau rs=Rrs/Ers$) was shorter in kittens (mean ±SE: 0.073±0.011 s) than in cats (0.121±0.008 s). This, associated with a faster decay in $Pmus_I$ in kittens, results in 2-3 times higher flows per kilogram body weight during spontaneous tidal expirations in kittens than in cats. As in the adult cats, the average values of active elastance and resistance were higher than the passive, the average percentage increase amounting to 59 and 49%, respectively. The greater active impedance reflects force-length and force-velocity properties of inspiratory muscles. Its price is higher work of breathing; its advantage is greater intrinsic load compensation. (17 refs.)

120886 Effect of temperature on the contractile properties and muscle power of triceps surae in humans. C.T.M.Davies, K.Young (Dept. of Physiology & Pharmacology, Univ. of Nottingham Medical School, Nottingham, England).
J. Appl. Physiol. (USA), vol.55, no.1, p.191-5 (July 1983).
The effects of heating and cooling on the electrically evoked mechanical and contractile properties of the triceps surae in relation to the maximal dynamic performance of the leg muscles during cycling and vertical jumping have been examined in five healthy male subjects. A mean rise of 3.1°C in muscle temperature (T_m) was associated with a decrease in time to peak tension (TPT) and half-relaxation time ($^1/_2RT$) but was without effect on twitch (P_{tO}) and tetanic tension at 20 Hz (P_{O20}) and 40 Hz (P_{O40}) and maximal voluntary contraction (MVC). Reducing T_m by 8.4°C had the opposite effect on TPT and $^1/_2RT$ and produced a fall in P_{tO}, P_{O40}, and MVC. The peak power output during cycling ($\dot{W}_1$) and jumping ($\dot{W}$) was linearly related to T_m as well as negatively associated with TPT. The best single guide to $\dot{W}$ and $\dot{W}_1$ was given by a ratio of MVC to TPT: $\dot{W}(W)=626.5+79.04$ (MVC/TPT)(N/ms; $r=+0.82$) and $\dot{W}_1(W)=1342+84.9$ (MVC/TPT)(N/ms; $r=+0.87$). The results underline the importance of the contractile and force generating capacity of human muscle in determining

maximal power output and performance during exercise of a few seconds' duration. (22 refs.)

120887 Mammalian tracheal dimensions: scaling and physiology. D.E.Leith (Brigham & Women's Hospital, Harvard Medical School, Boston, MA, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.196-200 (July 1983).
Mammalian tracheal dimensions vary with body mass in a way which suggests that expiratory flow limitation, inertance, and resistance are dominant constraints on tracheal design, rather than dead space or minimum work or effort. The fraction of total resistance attributable to the trachea appears to be about the same regardless of body size. Tracheal inertance appears to vary with body mass to the $-^1/_2$ power, so that inertial pressures, like elastic and resistive pressures, are invariant with body size and natural frequency, like respiratory frequency, varies with body mass to the $-^1/_4$ power. Other dominant constraints on tracheal design may include clearance functions and specialized habitat or behavior. (21 refs.)

120888 Pulmonary blood flow and tissue volume: model analysis of rebreathing estimation methods. G.M.Burma, G.M.Saidel (Dept. of Biomedical Engng., Case Western Reserve Univ., Cleveland, OH, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.205-11 (July 1983).
As the basis for comparing rebreathing methods of estimating pulmonary blood flow ($\dot{Q}$) and tissue-capillary volume (Vtc), the authors use a dynamic mass-balance model for gas species having different physicochemical properties (e.g. He, CO, C_2H_2). The model accounts for the effects of ventilation and perfusion inhomogeneities, breathing pattern variation, lung and rebreathing-bag volumes, and recirculation. Also, the authors examine the variability of the estimates caused by random error. In addition to analyzing two well-known methods, they show how an appropriate synthesis of these methods can lead to improved estimates. (15 refs.)

120889 Power output and fatigue of human muscle in maximal cycling exercise. N.McCartney, G.J.F.Heigenhauser, N.L.Jones (Dept. of Medicine, McMaster Univ. Health Sci. Centre, Hamilton, Ontario, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.218-24 (July 1983).
Maximal torque-velocity relationships and fatigue were studied during short-term maximal exercise on a constant velocity cycle ergometer in 13 healthy male subjects. Maximum torque showed an inverse linear relationship to crank velocity between 60 and 160 rpm, and a direct relationship to thigh muscle volume measured by computerized tomography. Peak torque per liter thigh muscle volume (PT, $N.ml^{-1}$) was related to crank velocity (CV, rpm) in the following equation: $PT=61.7-0.234$ CV ($r=0.99$). Peak power output was a parabolic function of crank velocity in individual subjects, but maximal power output was achieved at varying crank velocities in different subjects. Fiber type distribution was measured in the two subjects showing the greatest differences and demonstrated that a high proportion of type II fibers may be one factor associated with a high crank velocity for maximal power output. The decline in average power during 30 s of maximal effort was least at 60 rpm (23.7±4.6% of initial maximal power) and greatest at 140 rpm (58.7±6.5%). At 60 rpm the decline in power over 30 s was inversely related to maximal oxygen uptake ($ml.min^{-1}.kg^{-1}$) ($r=0.69$). Total work performed and plasma lactate concentration 3 min after completion of 30-s maximum effort were similar for each crank velocity. (29 refs.)

120890 End-expiratory level and breathing pattern in the newborn. G.B.Griffiths, A.Noworaj, J.P.Mortola (Dept. of Physiology, McGill Univ., Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.243-9 (July 1983).
In newborn mammals, the resting position of the respiratory system (V_R) is small due to a relatively high chest wall-to-lung compliance ratio. In dynamic conditions several indications suggest that the end-expiratory level functional residual capacity (FRC) is maintained above V_R. From the experiments described the authors conclude that in the puppy or larger species, including infants, who have a similar respiratory system time constant (τ) and a smaller breathing rate than the puppy, the breathing pattern alone does not explain the FRC-V_R difference. The rise in FRC must therefore result from the parallel action of mechanisms braking the expiratory flow, such as postinspiratory muscle activity and narrowing of the vocal cords. However, in the fastest breathing animals, such as the newborn rat, the breathing pattern alone may yield a more important elevation of FRC, even during tidal respiration. (21 refs.)

120891 Canine blood volume and cardiovascular function during hyperthermia. K.Miki, T.Morimoto, H.Nose, T.Itoh, S.Yamada (Dept. of Physiology, Kyoto Prefectural Univ. of Medicine, Kyoto, Japan).
J. Appl. Physiol. (USA), vol.55, no.2, p.300-6 (Aug. 1983).
The effect of acute hyperthermia on hemodynamic functions and blood volume regulation was examined on eight splenectomized dogs. Elevation of core body temperature by 2°C over 90 min caused significant increase in cardiac output (11.2±12.5 $ml.min^{-1}.kg^{-1}$ or about 10%) and significant decrease in total peripheral resistance (TPR; −1.3±1.0 $mmHg.s.ml^{-1}$ or about 20%), whereas blood volume (BV), plasma oncotic pressure, and intravascular protein mass remained unchanged. Thus the raised core temperature caused peripheral vasodilation with decreased TPR and compensatory increase in cardiac output. Because BV remained unchanged during warming, mobilization of extravascular fluid did not occur; only the redistribution of blood to the vasodilated cutaneous circulation took place. To assess the effects of heat stress on transvascular fluid equilibrium, Ringer solution (10.7 $ml.kg^{-1}.10\ min^{-1}$) was infused under normothermic and hyperthermic conditions. The volume of fluid retained within the intravascular space under equilibrium state was 33.5% in hyperthermia and 9.4% in normothermia. In hyperthermia, the transvascular fluid shift and urinary output were decreased both during and after infusion. The role of preferential fluid retention within the intravascular space observed during hyperthermia was discussed in relation to the mechanism to maintain cardiovascular function and BV under heat stress. (19 refs.)

120892 Mechanical properties of the upper airway. M.Cauberghs, K.P.van de Woestijne (Lab. voor Longfunktieonderzoek, Acad. Ziekenhuis St. Rafael, Leuven, Belgium).
J. Appl. Physiol. (USA), vol.55, no.2, p.335-42 (Aug. 1983).
The series and shunt components of the impedance of the upper airway (Zuaw) were evaluated from measurements obtained during a Valsalva maneuver by means of a modified forced oscillation technique. When the cheeks are supported, the upper airway can be represented by a single distributed transmission line. The homogeneity of this line was confirmed by measuring separately Zuaw and the impedance of the mouth. Correction of the impedance of the respiratory system, determined by means of the forced oscillations technique, for the shunt properties of Zuaw results in some modifications of the frequency dependence of resistance (Rrs) in healthy adults and in marked changes of the absolute values of Rrs in children and in patients with obstructive lung disease. (13 refs.)

120893 Influence of chest wall distortion on esophageal pressure. P.N.LeSouef, J.M.Lopes, S.J.England, M.H.Bryan, A.C.Bryan (Res. Inst., Hospital for Sick Children, Toronto, Ontario, Canada).
J. Appl. Physiol. (USA), vol.55, no.2, p.353-8 (Aug. 1983).
The caudocephalad profile of esophageal pressure swings was studied in 10 preterm and 5 full-term infants, and the effect of chest wall distortion on esophageal pressure swings was analyzed in 12 preterm infants. Esophageal pressure was measured with a fluid-filled catheter, tidal volume with a pneumotachograph, mouth pressure with a face mask and pressure transducer, and rib cage and abdominal motion with magnetometers. In preterm infants the profile of esophageal pressure swings fell very steeply in the caudocephalad direction. In full-term infants it was flat during quiet sleep and steep during rapid-eye-movement sleep. When breaths, standardized for pleural pressure, were compared between a period with maximal and a period with minimal chest wall distortion, esophageal pressure swings for both spontaneous and occluded breaths were higher in the former period. It concluded that the compliant preterm rib cage results in an uneven distribution of pleural pressure and that this distribution varies with changes in chest wall distortion. Esophageal pressure measurements are therefore an unreliable estimate of mean pleural pressure in the preterm infant and can be unreliable in the term infant. (23 refs.)

120894 Effect of chest wall distortion on occlusion pressure and the preterm diaphragm. P.N.LeSouef, J.M.Lopes, S.J.England, M.H.Bryan, A.C.Bryan (Res. Inst., Hospital for Sick Children, Toronto, Ontario, Canada).
J. Appl. Physiol. (USA), vol.55, no.2, p.359-64 (Aug. 1983).
The effect of chest wall distortion (CWD) on transdiaphragmatic pressure (Pdi) and/or mouth pressure during end-expiratory airway occlusions was studied in seven preterm infants. The authors measured mouth occlusion pressure (Pmo) with a face mask and pressure transducer, gastric pressure (Pga) with a fluid-filled catheter, diaphragmatic electromyogram (Edi) using surface electrodes, and rib cage and abdominal motion using magnetometers. They reasoned that $Pdi=Pmo-Pga$ on airway occlusion. Periods with maximal and periods with minimal CWD were compared. They found that (1) when CWD was minimal, an increase in Edi produced an increase in Pmo or Pdi in four infants; (2) when breaths were in the same Pmo of Pdi from each period in each infant were compared, those from the period with greatest CWD had an increased Edi (mean increase 76%, $P<0.005$, and 144%, $P<0.01$, for Pmo and Pdi, respectively). It is concluded that in preterm infants, Pmo can be a poor indicator of respiratory drive, and CWD markedly limits the effectiveness of the diaphragm as a force generator. (24 refs.)

120895 Esophageal pressure in infants at elevated lung volumes and positive airway pressure. C.S.Beardsmore, J.Stocks, M.Silverman (Dept. of Paediatrics & Neonatal Medicine, Univ. of London, London, England).
J. Appl. Physiol. (USA), vol.55, no.2, p.377-82 (Aug. 1983).
The measurement of esophageal pressure changes (ΔPes) under conditions of elevated lung volume or continuous positive airway pressure (CPAP) was investigated in a group of 17 infants by use of an esophageal balloon. Eleven of the infants were studied in a whole-body plethysmograph, and lung volume was increased by a volume injection technique. Reproducible measurements of lung volume in the plethysmograph showed that changes in mask pressure (ΔPm) were accurate during airway occlusion in 10 of the 11 infants. A progressive elevation of the ratio ΔPes/ΔPm during respiratory efforts against occlusion at lung volumes above the tidal range was observed in 8 of the 11 infants. In only one of these infants could the error have been in ΔPm measurement. Of seven infants (including one common to both studies) studied under CPAP, six also showed this effect, which occurred predominantly in very young or preterm infants. Changes in esophageal pressure in infancy, measured at high lung volumes or pressures, may not be representative of mean pleural pressure changes. (20 refs.)

120896 Effects of phrenic stimulation on upper airway resistance in anesthetized dogs. S.B.Gottfried, K.P.Strohl, W.van de Graaff, J.M.Fouke, A.F.diMarco (Dept. of Medicine, Cleveland Metropolitan General Hospital, Cleveland, OH, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.419-26 (Aug. 1983).
The effects of changes in the balance of forces, produced by chest wall and upper airway muscle contraction on upper airway patency, was evaluated in 10 spontaneously breathing anesthetized dogs. Bilateral phrenic nerve stimulation was performed in-phase and out-of-phase with spontaneous upper airway muscle contraction, while inspiratory upper airway resistance was monitored as an index of airway patency. The findings show that a mismatch in the activation of the upper airway and chest wall muscles is a major factor predisposing to airway occlusion. The authors suggest that such a mismatch will change upper airway resistance depending on airway size, geometry, or compliance. In formation concerning how electrical activation of upper airway muscle changes these mechanical aspects of the upper airway would be crucial in gaining greater understanding of the way upper airway patency is maintained during normal breathing. In addition, the region of the hyoid arch appears to be a vulnerable region for increased flow resistance in the upper airway. (32 refs.)

120897 Regional medullary blood flow during isocapnic hyperpnea in anesthetized cats. J.A.Neubauer, D.A.Strumpf, N.H.Edelman (Dept. of Medicine, Univ. of Medicine & Dentistry of New Jersey, New Brunswick, NJ, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.447-52 (Aug. 1983).
This study was performed to test the hypothesis that an increase in the activity of medullary respiratory neurons, which is not associated with change in arterial blood gas tensions, results in an increase in the blood flow within the medulla. The authors studied 12 anesthetized cats during isocapnic hyperpnea induced by either electrical simulation of hindlimb muscle groups (change in minute ventilation equalled 220%) or by carotid sinus nerve stimulation (change in peak phrenic activity.min^{-1} equalled 180%). Changes in total brain blood flow and in ventral and dorsal medullary blood flow were measured using the radioactive microsphere (15 μm) technique. In each cat measurements were made both before and after isocapnic hyperpnea had been sustained for 4 min. The data obtained indicate that stimulation of respiratory motor neurons without change in arterial blood composition enhances perfusion of the ventral medulla. The finding suggests that motor neuron stimulation is accompanied by a substantial increase in metabolic rate of the ventral medulla with release of metabolic products which mediate the vasodilation. These metabolic products could also act as positive feedback stimuli for the central chemoreceptor. (28 refs.)

120898 Effect of a hydrostatic pleural pressure gradient on mechanical behavior of lung lobes. B.G.Murphy, F.Plante, L.A.Engel (Meakins-Christie Labs., McGill Univ., Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.2, p.453-61 (Aug. 1983).
Using ^{133}Xe, the vertical distribution of regional volume (Vr) was measured in three regions of excised canine lobes both in air and when completely submerged in saline at 40, 60, 70, and 80% lobar vital capacity (VC). The estimated pleural pressure gradient, derived from values of Vr, distance bet-

ween regions, and the lobar pressure-volume (PV) curve, underestimated the true gradient by 45%. Conversely, the gradient of Vr was substantially less than predicted. From the mean depth of each region below the waterline, pleural, and hence transpulmonary pressure (PL) was computed. The values of Vr-PL points on the lobar PV curve to corresponding Vr-PL points in submerged lobes represent an effective regional compliance of a lobe undergoing deformation. With one exception this was less than the corresponding homogeneous compliance, indicating a stiffening of the lobe during deformation. (20 refs.)

120899 Gas transport during high-frequency ventilation. V.Brusasco, T.J.Knopp, K.Rehder (Dept. of Anesthesiology & Physiology & Biophys., Mayo Clinic, Rochester, MN, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.472-8 (Aug. 1983).
During high-frequency small volume ventilation (HFV), the transport rate of gas from mouth to a lung region is a function of two conductances: regional longitudinal gas conductance along the airways (Gr_{longi}) and gas conductance between lung regions (G_{inter}). Gr_{longi} per unit regional lung (gas) volume [$Gr_{longi}/(Vr\beta g)$] was determined during HFV in 11 anesthetized paralyzed dogs, lying supine. The i distribution of $Gr_{longi}/(Vr\beta g)$ was nearly uniform during HFV when stroke volumes were less than approximately two-thirds of the Fowler dead-space volume. By contrast, the distribution of $Gr_{longi}/(Vr\beta g)$ was nonuniform when the stroke volume exceeded approximately two-thirds of the Fowler dead-space volume and the oscillation frequency was 5 Hz. Gas conductance along the airways per unit lung gas volume [average $G_{longi}/(V\beta g)$], for the entire lung, increased with stroke volume at all frequencies, but for a given product of oscillation frequency and stroke volume, the average $G_{long}Di/(V\beta g)$ increased with frequency up to a maximal value; the frequency at which the maximum occurred on the kinematic viscosity of the inspired gas mixture. (9 refs.)

120900 Mechanical and gas-distribution behavior of a collateral ventilation model. A.G.Cutillo, C.H.Durney, A.D.Renzetti,Jr. (Dept. of Internal Medicine, Univ. of Utah, Salt Lake City, UT, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.503-11 (Aug. 1983).
The theoretical analysis of A.B. Otis et al. (ibid., vol.8, p.427-43, 1956) was extended to study the effects of collateral ventilation on lung mechanics and gas distribution. Equations were developed to express the effective compliance, the effective resistance, and the distribution of airflow and tidal volume in a two-compartment model incorporating a collateral communication. The analysis of the model showed that, in general, collateral ventilation tends to attenuate the degree of frequency dependence of compliance and resistance, the magnitude of this effect being dependent on the mechanical properties of the model, including collateral resistance. The present theoretical data suggest that the use of equations based on a model incorporating collateral ventilation is justified, at least in predicting the mechanical and gas-distribution behavior of the lung in emphysema. (19 refs.)

120901 A model of inspiratory muscle mechanics. P.T.Macklem, D.M.Macklem, A.de Troyer (Meakins-Christie Labs., McGill Univ. Clinic, Royal Victoria Hospital, Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.2, p.547-57 (Aug. 1983).
The diaphragm may be modelled pneumatically or electrically as two generators or pumps in series between the lung and abdomen. As such, the force developed by diaphragmatic contraction is the sum of the forces developed in each part, whereas the volume displaced is the same for each part and equal to the total volume displaced. The coastal part of the diaphragm is in series with the intercostal and accessory (IA) muscles between the lung and RC, whereas the crural part is in parallel. The volume displaced by simultaneous contraction of the crural part and IA is the sum of volumes displaced by each part. The action of pleural and abdominal pressure [acting through the area of apposition (Aap) of the diaphragm to RC] can be modelled as a summing junction between IA and RC. With hyperinflation the costal part acts more and more in parallel with both IA and the crural part, whereas Aap diminishes, so that the ability to develop large forces decreases independently of the muscles' force-length relationships. (14 refs.)

120902 Simultaneous quantitation of knee ligament forces. E.P.France, A.U.Daniels, E.M.Goble, H.K.Dunn (Orthopedic Bioengng. Lab., Univ. of Utah Coll. of Medicine, Salt Lake City, UT, USA).
J. Biomech. (GB), vol.16, no.8, p.553-64 (1983).
An apparatus and experimental technique have been developed which allow the simultaneous quantitation of human cadaver knee ligament forces with the knee in various positions and subjected to various loads. The methodology permits all the major ligaments of the knee to be kept intact, thus preserving much of their normal relative load-bearing function. A novel measurement technique was employed for ligament force measurement. Strain gauges were placed at the ligamentous insertions and origins either on cortical bone or the cancellous/cortical transition. Gauge output was subsequently calibrated quantitatively by cutting the ligaments and subjecting them to known loads. The gauging technique was thermally stable, and the method as a whole yielded reproducible relative ligament force data when knee positions and loads were repeated for a given knee specimen. Three fresh human cadaver knee specimens have been subjected to testing thus far with gauges at six ligamentous sites. (16 refs.)

120903 Bone stress in the horse forelimb during locomotion at different gaits: a comparison of two experimental methods. A.A.Biewener (Museum of Comparative Zoology, Harvard Univ., Cambridge, MA, USA), J.Thomason, A.Goodship, L.E.Lanyon.
J. Biomech. (GB), vol.16, no.8, p.565-76 (1983).
Longitudinal stresses acting in the cranial and caudal cortices of the radius and the dorsal and palmar cortices of the metacarpus in the horse were determined using two independent methods simultaneously. One approach involved the use of rosette strain gauges to record in vivo bone strain; the other involved filming the position of the horse's forelimb as it passed over a force plate. Agreement between the two analyses was better for the radius than for the metacarpus. Both methods showed the radius to be loaded primarily in sagittal bending, acting to place the caudal cortex in compression and the cranial cortex in tension. At each gait the magnitude of peak stress in each cortex based on the film/force analysis was 1.5-2 times higher than that determined from the bone strain recordings. In the metacarpus, the magnitude of stress in each cortex calculated from the film/force method was 2-3 times greater at each gait than that shown by the bone strain recordings. (29 refs.)

120904 Some mechanical properties of goose femoral cortical bone. G.B.McAlister, D.D.Moyle (Dept. of Interdisciplinary Studies, Clemson Univ., Clemson, SC, USA).
J. Biomech. (GB), vol.16, no.8, p.577-89 (1983).
The ultimate compressive strength and modulus of elasticity of femoral cortical bone from adult geese (Anser anser), were determined by sex and by quadrant by compressing small right circular cylinders which were 2.4 mm in height and 0.8 mm in diameter. The average ultimate compressive strength was 183±29 MPa. The average modulus of elasticity was 13.2±3.4 GPa. The bending strength and bending modulus of elasticity were determined by a three point bend test on rectangular prisms which had the approximate dimensions 0.75 mm×0.75 mm×25 mm. The average bending strength was 263±44 MPa while the average bending modulus was 19.6±3.1 GPa. The calcium content was determined by atomic absorption spectrophotometry and no correlation was found with the mechanical properties. The histology of the cortical bone was examined both quantitatively and qualitatively. A unique type of Haversian bone is described. (17 refs.)

120905 Fourier analysis of ground reaction forces in normals and patients with knee joint disease. E.Schneider, E.Y.Chao (Orthopedic Biomech. Lab., Mayo Clinic/Mayo Foundation, Rochester, MN, USA).
J. Biomech. (GB), vol.16, no.8, p.591-602 (1983).
Fourier analysis was performed on the ground reaction force patterns during gait in 26 normals and 10 patients with knee joint disease prior to total knee replacement. A method was developed to determine the essential number of harmonics for each force component, based on data sampling rate and the level of accuracy required in reconstructing the original patterns. The criteria used to select the level of accuracy depend upon the type of analysis to be performed. Only the first two to four harmonics, plus the constant term, were found to be the dominating coefficients in describing each of the reaction force patterns, and they are subsequently used as the key parameters in the differentiating normals and patients with knee joint disease. The advantages of this method and its implication to objective gait analysis in biomechanics are discussed. (25 refs.)

120906 The effects of composition, structure and age on the torsional properties of the human radius. D.B.Burr, R.B.Martin (West Virginia Univ. Medical Center, Morgantown, WV, USA).
J. Biomech. (GB), vol.16, no.8, p.603-8 (1983).
A standard site in the distal shaft of the radius is commonly used to monitor the skeletal status of aging individuals by photon absorptiometry. Since the adjacent metaphysis of this bone is a common site for fractures, it is important to know whether bone mineral content (BMC) is a good indicator of mechanical integrity. In concert with previous studies, the BMC of the scan site declined significantly ($p<0.005$) with age in women but in men showed no change to age 90. In spite of the loss of BMC, there was no decrease in torsional rigidity in women. In men torsional rigidity increases significantly ($p<0.05$) with age even though BMC did not change. Thus, measurements of BMC alone do not adequately reflect the mechanical integrity of a clinically significant skeletal site, and assessment of skeletal health based on such criteria may be misleading. (25 refs.)

120907 Field measurements in snow skiing injury research. C.Y.Kuo, J.K.Louie, C.D.Mote,Jr. (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
J. Biomech. (GB), vol.16, no.8, p.609-24 (1983).
Field measurements during skiing experiments simultaneously recorded the complete excitation of the toe and heel of one foot, the absolute spatial orientation of the pelvis and the foot, muscle activity at the hip, knee and ankle and the complete rotation of the femur relative to the tibia across the knee in three test subjects. Data were transmitted from test subjects during the skiing experiments by a 100K bit s^{-1}. PCM-FM system and recorded in digital form. Analyses of field data show the magnitude of the loading applied to the lower extremity during normal skiing often exceeds the expected, quasistatic ultimate strength of the tibia. Anterior-posterior bending of approximately 600 Nm has been recorded during skiing without binding release or injury to the test subjects. (16 refs.)

120908 Model studies on the influence of nonstationary flow on the mean flow estimate with the indicator-dilution technique. E.A.von Reth, J.C.J.Aerts, A.A.van Steenhoven (Dept. of Mech. Engng., Eindhoven Univ. of Technol., Eindhoven, Netherlands), A.Versprille.
J. Biomech. (GB), vol.16, no.8, p.625-33 (1983).
The applicability of the indicator-dilution technique for the estimate of the mean flow under circumstances of nonstationary flow is investigated by model studies. The studies comprise experiments using a hydrodynamical model as well as calculations with a compartmental approach. The main conclusions are: (1) The influence of nonstationary flow on the mean flow estimate with the indicator-dilution technique can be described accurately by a mathematical mode based on a mixing-chamber approach. (2) The relative error in the mean flow estimate by a single measurement is dependent on the system parameters (number and time constant of mixing chambers) and the flow parameters (relative amplitude and relative frequency of flow variation and the phase with respect to the variation at the moment of injection). (3) Errors due to cyclic nonstationarities of the flow can be reduced strongly by averaging over two measurements with injection at two points of time with phases π radians apart. (13 refs.)

120909 Estimation of respiratory impedance and source pressure using a Thevenin equivalent circuit model. E.J.Cha, K.S.Park, C.W.Lee, K.Y.Yim, B.G.Min (Dept. of Biomedical Engng., Seoul Nat. Univ. Hospital, Seoul, Korea).
J. Biomech. (GB), vol.16, no.8, p.635-41 (1983).
A new technique is presented which can provide both active respiration source pressure and lung impedance in a single noninvasive test. The method is based upon a Thevenin equivalent circuit model of respiratory mechanics. Using this model, the equivalent source pressure and source impedance can be computed from the measured changes of respiratory pressures and flows in two consecutive cycles before and after addition of purely resistive loads to the mouth. In maximal breathing the source parameters were reproducible in six normal human subjects. The total respiratory resistance during maximal breathing had an average value of 3.46 cm $H_2O\ 1^{-1}\ s^{-1}$, and the total dynamic compliance had an average value of 0.0781 cm H_2O^{-1}. The airway resistances measured using a plethysmographic method were within the range of 45-65% of the estimated total respiratory resistances. These two resistances were related with a correlation coefficient of 0.98. (24 refs.)

120910 On large periodic motions of arteries. H.Demiray (Marmara Res. Inst., Kocaeli, Turkey), R.P.Vito.
J. Biomech. (GB), vol.16, no.8, p.643-8 (1983).
The large, radial periodic motion of an artery subjected to a dynamic inner pressure is studied through the use of finite deformation theory of elastic materials. The artery is assumed to behave as an isotropic, homogeneous, and incompressible elastic material. Expressions for intramural pressure and wall stresses are obtained as a function of the large periodic motion. Dynamic effects are shown to both increase the diastolic pressure and decrease the systolic pressure. It is also shown that, under certain conditions, the artery may experience a negative intramural pressure, in which case the artery may collapse. The authors predict very large circumferential stress and stress gradients which might lead the artery to arteriosclerosis. (15 refs.)

120911 Mechanics of gliding in birds with special reference to the influence of the ground effect. R.W.Blake (Dept. of Zoology, Univ. of British Columbia, Vancouver, BC, Canada).
J. Biomech. (GB), vol.16, no.8, p.649-54 (1983).
A model of the mechanics of gliding without loss of altitude (horizontal gliding) is developed. The model can be employed to assess the influence of the principal drag components (induced, profile and parasite drag), choice of initial and final glide velocities and height above the ground on glide distance. For birds gliding near to the ground the ground effect acts to decrease the induced drag and increase the lift to drag ratio of the wings. Minimum drag speed is reduced for birds gliding near to the ground. The model is applied to the gliding flight of the black skimmer (Rhyncops nigra). Glide distances for given initial and final velocities are significantly increased in the influence of the ground effect out of ground effect values. (19 refs.)

120912 The influence of aerodynamic and biomechanical factors on long jump performance. A.J.Ward-Smith (Dept. of Mech. Engng., Brunel Univ., Uxbridge, England).
J. Biomech. (GB), vol.16, no.8, p.655-8 (1983).
A new analysis, based on the equations of motion, is made of the influence of aerodynamic drag on the trajectory and aerial range achieved by a long jumper. The general result is applied to a particular case, namely the world long jump record obtained by Bob Beamon at the Mexico Olympics in 1968. Calculations are also made of the influence of body height and jumping technique on overall long-jump performance. A comparison is made between the relative importance of aerodynamic and anthropometric aspects of long jump performance. (5 refs.)

120913 The effect of impact on the marrow pressure of long bones in vitro. J.D.Bryant (Dept. of Biology, Univ. of York, Heslington, York, England).
J. Biomech. (GB), vol.16, no.8, p.659-65 (1983).
Intact fresh sheep tibiae were subjected to non-destructive impact loads while maintained in an environment like that encountered in life. Under a maximum load of 2.5 kN, and loading rate of 500 N ms^{-1}, marrow presures no higher than 50 kPa were recorded. Such low pressures would provide only a trivial amount of hydraulic strengthening, and are consistent with results from other workers carried out at lower rates of loading. (8 refs.)

120914 Finite element modelling of lungs including interlobar fissures and the heart cavity. G.C.Lee, N.T.Tseng, Y.M.Yuan (Faculty of Engng. & Appl. Sci., State Univ. of New York, Buffalo, NY, USA).
J. Biomech. (GB), vol.16, no.9, p.679-90 (1983).
Interlobar fissures and the heart cavity are incorporated into a solid lung model and their effect on the regional behavior of the lung is examined. Numerical results show that the interlobar fissures have a 'shielding' effect on the stress distribution in the upper region of the lung. The stress gradient can be reduced dramatically due to the relative movement of parenchyma along the fissure planes. Also, the heart cavity and the hilum support have the same effect of reducing the expansion ratio of parenchyma in the upper region of the lung. Therefore, the interlobar movement and the heart cavity tend to reduce the unevenness of stresses and strains in the lung as compared with the results of the solid lung model used previously by West and Matthews (1972) and used by the authors (Lee et al., 1978). (18 refs.)

120915 Correlation of myoelectric activity and muscle force during selected cat treadmill locomotion. M.H.Sherif, R.J.Gregor (Univ. of California, Los Angeles, CA, USA), L.M.Liu, R.R.Roy, C.L.Hager.
J. Biomech. (GB), vol.16, no.9, p.691-701 (1983).
The force produced by the cat medial gastrocnemius (MG) during unrestrained treadmill locomotion was associated with the corresponding myoelectric signals (MESs). An intervention analysis based on an autoregressive-integrated moving average process was performed on records obtained at treadmill speeds of 0.67 m s^{-1} and 2.24 m s^{-1}. Results indicate that the pattern of MG myoelectric activity during a single step cycle may be divided into two parts. The primary burst (E_1 burst) of activity occurs before foot contact and represents an energy build up which is related to a major part of the MG force monitored at the tendon. During stance, a second burst of activity is depicted by an almost critically damped second order system, and is responsible for the residual tension observed. Thus in vivo forces can be linked to MESs provided that phase differences between electrical and mechanical responses are taken into account. (34 refs.)

120916 Analysis of the passive mechanical properties of rat carotid arteries. H.W.Weizsacker, H.Lambert, K.Pascale (Physiologisches Inst., Karl Franzens Univ., Graz, Austria).
J. Biomech. (GB), vol.16, no.9, p.703-15 (1983).
The passive mechanical properties of rat carotid arteries were studied in vitro. Using a tensile testing machine and a piston pump, intact segments of carotid arteries were subjected to large deformations both in the longitudinal and circumferential directions. Internal pressure, external diameter, length, and longitudinal force were measured during the experiment and compared with the in vivo dimensions of the segments prior to excision. The anisotropic mechanical properties of the vessel wall material were analyzed using incremental elastic moduli and incremental Poisson's ratio. The results suggest that there is a characteristic deformation pattern common to all vessels investigated which is highly correlated with the conditions of loading that occur in vivo. That is, under average physiological deformation of the vessel, the longitudinal force is nearly independent of internal pressure. In this range of loading the circumferential incremental elastic modulus is nearly independent of longitudinal strain. However, the longitudinal and radial incremental elastic moduli vary significantly with deformation in this direction. The values of the moduli in all three directions increase with raising internal pressure. The weak coupling between circumferential and longitudinal direction in the wall material of carotid arteries is shown by the small value of the corresponding incremental Poisson's ratios. (29 refs.)

120917 Quantitative gait evaluation of hip diseases using principal component analysis. S.Yamamoto, Y.Suto, H.Kawamura, T.Hashizume, S.Kakurai (Tokyo Metropolitan Prosthetic & Orthotic Res. Inst., Tokyo, Japan), S.Sugahara.
J. Biomech. (GB), vol.16, no.9, p.717-26 (1983).
The measurement of five gait parameters, namely, joint angular displacement of flower extremities, floor reaction forces, trajectory for a point of force application, temporal factor and distance factor has been performed with ease and high speed using mini-computer on-line real-time processing. Gait data of 211 patients with hip diseases was normalized, quantified and summarized by the principal component analysis. A 'gait evaluation plane' was formed according to the results obtained by the principal component analysis. The gait evaluation using the plane was compared with clinical conditions of patients, and it was evident that this system can evaluate the recovery of the gait by treatment. (14 refs.)

120918 Finite-element-analysis and experimental investigation in a femur with hip endoprosthesis. A.Rohlmann, U.Mossner, G.Bergmann (Dept. of Orthopaedic Surgery, Free Univ. Berlin, Berlin, Germany).
J. Biomech. (GB), vol.16, no.9, p.727-42 (1983).
The stress distribution in a human femur with an endoprosthesis was determined. The finite element method (FEM) was used for a three-dimensional model with more than 15000 degrees of freedom. Geometrical and material data had been taken for this model from a left femur with endoprosthesis. On the contralateral bone a strain gauge investigation was performed to validate the calculations. Reasonable agreement was achieved. Various modes of loading were investigated. A perfect bond at the interface between materials of different elastic moduli was assumed. The results are valid for endoprosthesis with such structured stem surfaces as allow transfer of tensile and shear stresses. (27 refs.)

120919 Multiaxial strength characteristics of trabecular bone. J.L.Stone, G.S.Beaupre, W.C.Hayes (Charles A. Dana Res. Inst., Beth Israel Hospital, Boston, MA, USA).
J. Biomech. (GB), vol.16, no.9, p.743-52 (1983).
Bovine trabecular bone specimens were tested in multiaxial stress, including pure shear, in a special test device. Shear strength was proportional to apparent density to the exponent 1.65, in approximate agreement with theoretical and experimental studies on the shear strengths of porous foams. The mean shear strength was 6.60±1.66 MPa, after normalizing for apparent density. This compares well with normalized shear strengths from Saha and Gorman's (1981) study on human femora. A scanning electron microscope study indicated random trabecular architecture and a complex fracture mechanism at the level of the individual trabecular struts. Hoffmann's (1967) 3-D isotropic failure criterion was applied to the multiaxial test data, along with data from uniaxial compression tests, indicating a compressive strength approximately three times the tensile strength. (34 refs.)

120920 Comparison of steady and pulsatile flow in a double branching arterial model. R.J.Lutz, L.Hsu, A.Menawat, J.Zrubek, K.Edwards (Div. of Res. Services, Nat. Inst. of Health, Bethesda, MD, USA).
J. Biomech. (GB), vol.16, no.9, p.753-66 (1983).
Data are presented to compare fluid flow parameters for steady flow with those for time-varying flow in a simplified two branch model which simulates the region of the abdominal aorta near the celiac and superior mesenteric branches of the dog. Measurements in the model included laser doppler anemometry velocity profiles during steady flow, sinusoidal flow with a superimposed mean flow (referred to as simple oscillatory flow) and arterial pulsatile flow. Shear rate measurements were made by an electrochemical technique during steady flow. Flow visualization studies were done during steady and pulsatile flow. Fluid flow effects in the simplified model during steady flow showed many similarities to the results from previous steady flow studies in a canine aortic cast (Lutz et al., 1977). Shear rates in the region of the proximal (first, or celiac) branch were independent of flow rates in the distal (second, or mesenteric) branch, but the shear pattern within the proximal branch changed significantly as flow in the proximal branch increased. Shear rates on the proximal flow divider (leading edge into the distal branch) depended primarily on the flow rate to the proximal branch, but not on flow to the distal branch. At certain daughter branch flow ratios (approximately 2:1, proximal to distal), flow separation was promoted at the outer wall of the second branch, but flow separation did not occur in the first branch. (33 refs.)

120921 Comparative evaluation of techniques for the harmonic analysis of human motion data. A.Cappozzo, F.Gazzani (Lab. of Biomech., Univ. degli Studi 'La Sapienza', Roma, Italy).
J. Biomech. (GB), vol.16, no.9, p.767-76 (1983).
Four mathematical techniques for the estimation of the Fourier coefficients of pseudoperiodic nonexact discrete functions were submitted to comparative evaluation. These techniques were devised within the following basic procedures: (1) numerical harmonic analysis applied either directly or after redistribution of the data points through some interpolation procedure, so that they be evenly spaced in time and exactly fit one cycle period; (2) fitting of the empirical data with an analytical model followed by the calculation of the Fourier integrals of this model. The evaluation was carried out with special reference to the use of these techniques for processing human motion photogrammetric data. The following criteria were used: (1) accuracy of the Fourier coefficient estimates, (2) capability of yielding information about this accuracy, (3) a priori information needed regarding the statistical properties of the experimental error, (4) factors concerning implementation in digital computers. Practical information was obtained for the nonspecialist user with regard to the choice of one technique among the several possible in particular cirumstances. (14 refs.)

120922 Response of a two-dimensional dynamic model of the human knee to the externally applied forces and moments. M.H.Moeinzadeh (Dept. of General Engng., Univ. of Illinois, Urbana-Champaign, IL, USA), A.E.Engin.
J. Biomed. Eng. (GB), vol.5, no.4, p.281-91 (Oct. 1983).
Deals with the response of a two-dimensional dynamic model of the human knee to the externally applied forces and moments. The profiles of the articulating surfaces of a normal knee joint are determined from X-ray films and they are represented by polynomials. Ligaments of the joint are modelled as nonlinear elastic springs of realistic stiffness properties. Nonlinear equations of motion, coupled with nonlinear constraint conditions, are solved numerically. Time derivatives are approximated by Newmark difference formula and the resulting nonlinear algebraic equations are solved employing the Newton-Raphson iteration scheme. Several dynamic loads (force and moment) are applied to the tibia and subsequent motion is investigated. Results for the ligament and contact forces, contact point locations between femur and tibia and the corresponding dynamic orientation of tibia with respect to femur are presented. (36 refs.)

120923 Effect of myocardial fibre architecture on the behaviour of the human left ventricle in diastole. A.L.Yettram (Dept. of Mech. Engng., Brunel Univ., Uxbridge, England), C.A.Vinson, D.G.Gibson.
J. Biomed. Eng. (GB), vol.5, no.4, p.321-8 (Oct. 1983).
Stress and deformation results from finite element analyses are presented for a series of models of the human left ventricle. The myocardium has a complex anisotropic fibre structure, an idealized version of which has been developed. Variations are made on both fibre orientation and on the ratio of the elastic moduli along and across the fibres. The results show that, at least in diastole, when the left ventricle is considered as a passive structure under the action of the internal blood pressure, the effect of the real fibre arrangement is generally to reduce deformation and also the direct stresses. In spite of fibre angle changing across the wall, the analysis correctly predict the lack of rotation of the left ventricle about the long axis. (17 refs.)

120924 Etiology and biomechanics of hernial sac formation. A.E.Engin (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA), N.Akkas.
J. Biomed. Eng. (GB), vol.5, no.4, p.329-35 (Oct. 1983).
This paper, to the authors' best knowledge, presents the first attempt on the understanding of the biomechanics of hernial sac formations. First, a brief survey of the selected etiological factors and their related theories on hernia is given. Next, the results of some preliminary tensile tests conducted on normal and sac peritoneum are discussed. The third part of the paper is concerned with a theoretical model which incorporates both material and geometric nonlinearities by considering deformation of circular membrane under internal fluid pressure. The influence of the material properties of the peritoneal sac, its thickness and its initial radius of curvature, as well as the internal fluid pressure on the growth of the sac are illustrated. The existence of a critical value for a non-dimensional parameter is shown and it is proposed that the herniation process can be viewed as a biomechanically unstable phenomenon in the light of the present model. (43 refs.)

120925 Evaluation of the mechanical behavior of compact deproteinized and demineralized bone tissue under tension. M.A.Dobelis, A.E.Melnis (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.719-25 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1060-6 (Nov.-Dec. 1982). [received: Sept. 1983]
The data obtained indicates that the method used for bone deproteinization permits investigation of the mineral bone component with retained structure of the hydroxyapatite crystals. The continuous mineral component is a composite, spatially organized structure with amorphous and crystalline segments. The rather high rigidity of this component indicates that the elastic properties of bone tissue are largely a factor of the mineral component. The strength and specific deformation energy of the mineral bone component are significantly enhanced due to effective distribution and transmission of microstresses by the organic component in the bone biocomposite itself. (16 refs.)

120926 Biomechanical aspects of the fracture resistance of the human spine upon the action of head-pelvis impact overloads. G.P.Stupakov, V.A.Elivanov, A.P.Kozlovskii, V.S.Kazeikin, V.V.Korolev.
Mech. Compos. Mater. (USA), vol.18, no.6, p.726-30 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1067-71 (Nov.-Dec. 1982). [received: Sept. 1983]
Experiments were carried out on segments of the human spine including two lower thoracic and three upper lumbar vertebrae (T_{XI}-L_{III}) as well as on human corpses. The segments were removed from the corpses of males (biological models) who died suddenly at ages from 20 to 50 years from causes not affecting the state of the skeletal system. The segments were subjected to impact on a pile-driver apparatus with a dropping platform after their prior stressing by a rigid structure (upper mass) corresponding to the mass of the lower body. (2 refs.)

120927 Elastic properties of the human aortic wall relative to aging. N.M.Fruntash (Kishinev State Medical Inst., Kishinev, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.730-4 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1072-6 (Nov.-Dec. 1982). [received: Sept. 1983]
The ultimate strength, rupture extension, and elasticity coefficient of the human aortic wall during postnatal ontogeny was investigated. The aorta was taken 8-14 h after death in individuals without cardiovascular pathology. The visually least altered segments of the aortic wall were taken for study from aged individuals. General atherosclerosis or the sclerosis of individual groups of vessels was indicated as an incidental diagnosis. (22 refs.)

120928 Effect of timing and velocity of impact on ventricular myocardial rupture. I.V.Lau (Biomedical Sci. Dept., General Motors Res. Labs., Warren, MI, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.1-5 (Feb. 1983). [received: Oct. 1983]
The effects of impact timing during the cardiac cycle on the sensitivity of the heart to impact-induced rupture was investigated in an open-chest animal model. Direct mechanical impacts were applied to two adjacent sites on the exposed left ventricular surface at the end of systole or diastole. Impacts at 5 m/s and a contact stroke of 5 cm at the end of systole resulted in no cardiac rupture in seven animals, whereas similar impacts at the end of diastole resulted in six cardiac ruptures. Direct impact at 15 m/s and a contact stroke of 2 cm at the end of either systole or diastole resulted in perforationlike cardiac rupture in all attempts. At low-impact velocity the heart was observed in high-speed movie to bounce away from the impact interface during a systolic impact, but deform around the impactor during a diastolic impact. The heart generally remained motionless during the downward impact stroke at high-impact velocity in either a systolic or diastolic impact. The lower ventricular pressure, reduced muscle stiffness, thinner myocardial wall and larger mass of the filled ventricle probably contributed to a greater sensitivity of the heart to rupture in diastole at low-impact velocity. However, the same factors had no role at high-impact velocity. (12 refs.)

120929 Filling of partially collapsed compliant tubes. D.L.Jan, R.D.Kamm, A.H.Shapiro (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.12-19 (Feb. 1983). [received: Oct. 1983]
Filling of a thin-walled, highly compliant tube in a partially collapsed condition is studied. The theory, based on one-dimensional flow, takes account of friction, longitudinal tension, and the highly nonlinear pressure-area law for the tube. Various aspects of filling behaviour are revealed by alternative calculations using: (i) the method of characteristics; (ii) numerical integration of the continuity, momentum, and tube-law equations; and (iii) a crude but simple lumped-element capacitance-inertance-resistance model. Varied phenomena appear. At high Reynolds number, these include dispersive wave trains associated with circumferential bending stiffness and longitudinal tension, nonlinear changes of waveform, development of highly asymmetrical wave reflections, and sloshing. At low Reynolds number, the area changes with time in a diffusivelike manner. The experiments exhibited the dispersive phenomena predicted by the theory. (17 refs.)

120930 Static analysis of the left ventricle. A.Tozeren (Dept. of Engng. Sci., Orta Dogu Teknik Univ., Ankara, Turkey).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.39-46 (Feb. 1983). [received: Oct. 1983]
Static analysis of the left ventricle is developed to estimate the local stresses and deformations that occur during the heart cycle. The left ventricle is represented as a thick hollow tube composed of solid fibers embedded in an inviscid fluid matrix. A finite deformation analysis is developed to estimate the variation of the pressure, fiber tension and fiber extension across the thickness of the left ventricle. Pressure-volume relations are obtained for the diastolic and the systolic peak isovolumetric phases. The fiber stress distribution and pressure variation are estimated as a function of the initial fiber orientation distribution, relative thickness of the ventricle, inner volume of the ventricle and the various tension-extension relations proposed for the fibers of the heart muscle. It is concluded that the diastolic pressure-volume relation is not very sensitive to either the fiber orientation distribution or the thickness of the ventricle. However, the pumping efficiency of the modeled ventricle is shown to increase with increasing thickness of the modeled left ventricle and with increasing contractility of the heart muscle fibers. (24 refs.)

120931 Rhesus monkey intervertebral disk viscoelastic response to shear stress. B.S.Kelley, J.F.Lafferty, D.A.Bowman, P.A.Clark (Wenner-Gren Aeronautical Res. Lab., Univ. of Kentucky, Lexington, KY, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.51-4 (Feb. 1983). [received: Oct. 1983]
A viscoelastic model of the shear response of the Rhesus monkey intervertebral disk, represented by a series chain of four Kelvin units is presented. Two types of investigations are carried out to assess the validity of the model: (1) determination of material properties by comparison with experimental strain creep behaviour of the disk; and (2) validation of this viscoelastic model by accurately predicting the experimental results of stress relaxation tests. The use of the series Kelvin units approach provides the first analytical mechanical model capable of predicting the creep and relaxation functions for the intervertebral disk in shear. (11 refs.)

120932 Joint models, degrees of freedom, and anatomical motion measurement. G.L.Kinzel, L.J.Gutkowski (Dept. of Mech. Engng., Ohio State Univ., Columbus, OH, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.55-62 (Feb. 1983). [received: Oct. 1983]
When the motion associated with an anatomical joint is to be measured, a kinematic model for the joint must first be established. The joint model will have from one to six degrees of freedom, and both the measurement technique and the means used to describe the motion will be influenced by the model and its degrees of freedom. This paper discusses the modeling and measurement of anatomical joint motion from a kinematics viewpoint. A review of the literature pertaining to measurement techniques, kinematic assumptions, and motion descriptions for anatomical joint motion is presented. One, two, three and six degree of freedom models for various anatomical joints have appeared in the literature, and the applicability of these models is compared and discussed. (69 refs.)

120933 Response of an advanced head-neck model to transient loading. J.M.Winters, W.Goldsmith (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.63-70 (Feb. 1983). [received: Oct. 1983]
A second-generation mechanical head-neck model was constructed, instrumented and subjected to pendulum impact tests against both the head and torso and directed from the front, rear and side. The response history of the system was measured by thirty channels of instrumentation including disk pressure transducers and muscle displacement gages in the neck, and a central accelerometer, intracranial pressure transducers and skull strain gages for the cranium and its contents. The kinematics of the unit was observed by an intermediate speed framing camera and the input was determined by a calibrated force transducer located at the contact point. It was found that peak head linear acceleration and velocity occur either during or immediately after the impact, with corresponding peak rotational values manifested somewhat later, but well before maximum head displacement. Head accelerations were similar, albeit slightly lower than in corresponding cases for an earlier model and displacement values were also similar until large extensions were reached. For rear head or frontal base impact, the head experienced a significant period of translation without rotation immediately after loading, and the system appears to respond more violently to side than to corresponding front or rear impact. (28 refs.)

120934 Mechanical behavior of fetal dura mater under large axisymmetric inflation. T.J.Kriewall (Orthopaedic Products Div., 3M Co., St. Paul, MN, USA), N.Akkas, D.I.Bylski, J.W.Melvin, B.A.Work,Jr..
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.71-6 (Feb. 1983). [received: Oct. 1983]
The nonlinear mechanical behavior of fetal dura mater was tested experimentally and compared to two published nonlinear material strain energy functions, the Mooney-Rivlin and the Skalak, Tozeren, Zarda, and Chien (STZC). The STZC constitutive relations best fit the behavior of the dura mater and were used to describe quantitatively its stiffness. Runge-Kutta numerical procedures were used to fit the theoretical data to the experimental results. The material's stiffness was positively correlated with fetal weight ($r=0.67$, $p<0.05$). These results are discussed and directions for future research indicated. (20 refs.)

120935 Acoustic modeling of lung dynamics using Bond graphs. D.L.Margolis, M.Tabrizi (Univ. of California, Davis, CA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.84-91 (Feb. 1983). [received: Oct. 1983]
Bond graphs are used to model the acoustic behavior of the respiratory system. The model includes the distributed dynamics of the upper airways while the lower passage generations are represented by 'lumping' of resistance and compliance effects. The lower airway representation is terminated with ten lung segments. The model is accurate for frequencies as high as 8500 Hz. The model is currently capable of predicting system eigenvalues as a function of system parameters and geometry for a 'nonbreathing' lung. Future plans include modifying the model to include lung segment expansion and contraction as well as turbulence generation at airway bifurcations. (13 refs.)

120936 A concise sensitivity analysis of the quasi-linear viscoelastic model proposed by Fung. A.A.H.J.Sauren, E.P.M.Rousseau.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.92-5 (Feb. 1983). [received: Oct. 1983]
Y.C.B. Fung (see Biomechanics: its foundations and objectives, ch.7, p.181-208, 1972) has proposed a quasi-linear viscoelastic theory which gives a constitutive equation relating stress and strain for a soft biological tissue. In order to account for the remarkable strain rate insensitivity of both the stress-strain relation and the hysteresis loop of many soft biological issues, Fung proposed a specific relaxation spectrum of the form $S(\tau)=C/\tau$ for $0<\tau_1\leq\tau\leq\tau_2$, and $S(\tau)=0$ elsewhere, where C represents a dimensionless positive constant and τ_1 and τ_2 are time constants. The authors analysis indicates that the parameter C is the most important as it determines the degree to which viscous effects are present. The time constants τ_1 and τ_2 govern respectively, the 'fast' and 'slow' viscous phenomena. (9 refs.)

120937 Impulse and moment of impulse in the leg joints by impact from kicking. L.Lindbeck (Dept. of Mech., Royal Inst. Technol., Stockholm, Sweden).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.108-11 (May 1983). [received: Oct. 1983]
In a previous paper (see Scand. J. Rehab. Med., vol.10, p.93-106, 1978) the authors gave a theoretical analysis of the impulsive motion of the leg, modeled as a double pendulum. This analysis made it possible to estimate the

impulsive reactions in the knee joint as a function of the measured initial and final velocities of the leg, when an impact was given to the lower leg, e.g. by means of a kick. This estimation was made under the assumption that no impulsive moments occur in the hip and the knee joints, i.e. that no muscles were stretched during the time of impact. In the present paper it is shown how such impulsive moments, should they occur, can be determined by means of an additional measurement, i.e. of the velocity of the ball after the impact. The results from a series of experiments are reported, showing that such impulsive moments in the joints occur in an appreciable number of the kicks, especially in the hip joint, indicating that muscles, acting on this joint, are prestressed during the impact. (3 refs.)

120938 Pulsatile flow in tapered tubes: a model of blood flow with large disturbances. E.Kimmel, U.Dinnar (Dept. of Biomedical Engng., Technion-Israel Inst. of Tech., Haifa, Israel).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.112-19 (May 1983). [received: Oct. 1983]
Blood flow-through segments of large arteries of man, between adjacent bifurcations, can be modeled as pulsatile flow in tapered converging tubes, of small angle of convergence, up to 2 deg. Assuming linearity, rigid tube and homogeneous Newtonian fluid, the physiological flow field is governed by the Navier-Stokes equation with dominant nonlinear and unsteady terms. Analytical solution of this problem is presented based on an integral method technique. The solution shows that even for small tapering the flow pattern is markedly different from the flow obtained for a uniform tube. The periodic shear stresses at the wall and pressure gradients increase both in their mean value and amplitude with increased distance downstream. These results are highly significant in the process of atherogenesis. (22 refs.)

120939 A joint coordinate system for the clinical description of three-dimensional motions: application to the knee. E.S.Grood, W.J.Suntay (Dept. of Orthopaedic Surgery, Univ. of Cincinnati Medical Center, Cincinnati, OH, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.136-44 (May 1983). [received: Oct. 1983]
The experimental study of joint kinematics in three dimensions requires the description and measurement of six motion components. An important aspect of any method of description is the ease with which it is communicated to those who use the data. This paper presents a joint coordinate system that provides a simple geometric description of the three-dimensional rotational and translational motion between two rigid bodies. The coordinate system is applied to the knee and related to the commonly used clinical terms for knee joint motion. A convenient characteristic of the coordinate system shared by spatial linkages is that large joint displacements are independent of the order in which the component translations and rotations occur. (29 refs.)

120940 An analytical technique for modeling knee joint stiffness. II. Ligamentous geometric nonlinearities. M.S.Hefzy, E.S.Grood (Dept. of Orthopaedic Surgery, Univ. of Cincinnati Medical Center, Cincinnati, OH, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.145-53 (May 1983). [received: Oct. 1983]
For pt.I see ibid., vol.104, p.330-7, 1982. The analytical technique previously developed in pt.I to evaluate the contribution of the ligaments to the nonlinear, coupled stiffness characteristics of the human knee joint is extended here to include geometric nonlinearities. In pt.I the authors assumed that the ligaments act as tensile bands running in a straight line between tibial and femoral insertion sites. Here, two forms of geometric nonlinearities are introduced and analyzed: ligaments wrapping around bone surfaces, such as occurs with the medical collateral ligament, the posterior capsule, and the anterior cruciate in hyperextension, and wrapping of ligaments around each other, such as occurs, with the cruciate ligaments as the knee is flexed and internally rotated. (16 refs.)

120941 Tension-torsion charcteristics of the canine anterior cruciate ligament. I. Theoretical framework. D.C.Stouffer (Univ. of Cincinnati, Cincinnati, OH, USA), D.L.Butler, H.Kim.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.154-9 (May 1983). [received: Oct. 1983]
It has been observed that the fascicles in the canine anterior cruciate ligament do not follow a straight line path between the tibial and femoral attachment sites, but rather their path is approximately helical about the ligament axis. Thus, a mathematical model for the mechanical response of a ligament was developed from the observed geometrical configuration of the fascicle. The principal result of the model indicated that a torque must always accompany the force during elongation of a ligament. The relationships between the ligament and fascicle variables are also examined in detail. (38 refs.)

120942 Tension-torsion characteristics of the canine anterior cruciate ligament. II. Experimental observations. D.L.Butler, D.C.Stouffer (Univ. of Cincinnati, Cincinnati, OH, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.160-5 (May 1983). [received: Oct. 1983]
For pt.I see ibid., vol.105, no.2, p.154-9, 1983. An experimental program was devised to determine whether the canine anterior cruciate ligament (ACL), with an apparent helical twist of its component fiber bundles, could support a torque during axial loading to failure. At the point of first significant failure, the anterior cruciate was found to develop an average maximum torque of 122 ± 26 N-mm ($\bar{X} \pm$SEM) for the nine tension-torsion tests performed. A nearly linear axial force-torque curve was also observed where the average slope of all tests was 5.2 ± 0.2 mm^{-1} ($\bar{X} \pm$SEM). The experimental axial force data was then used to determine material parameters in the constitutive equation for the fascicle and underlying bone. A nonlinear ligament model based on this response was found to reproduce the axial force data adequately and to reasonably predict the observed ligament torque over the entire subfailure loading range. (26 refs.)

120943 Cycle-dependent and time-dependent bone fracture with repeated loading. D.R.Carter, W.E.Caler (Mech. Engng. Dept., Stanford Univ., Stanford, CA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.166-70 (May 1983). [received: Oct. 1983]
Fatigue tests of human cortical bone (up to 1.74×10^6 cycles) were conducted under tension-compression (T-C) and zero-tension (O-T) modes with a 2 Hz, stress controlled, sinusoidal loading history. Tensile creep-fracture tests at constant stress levels were also performed. The relationship between the initial cyclic strain range and cycles to failure with the T-C specimens were consistent with that derived previously in low-cycle fatigue under strain control. Using a time-dependent failure model, the creep-fracture data was found to be consistent with previous studies of the influence of strain rate on the monotonic tensile strength of bone. The model also predicted quite well the time to failure for the O-T fatigue specimens, suggesting that creep damage plays an important role in O-T fatigue specimens. (24 refs.)

120944 Pre-collapse stress redistributions in femoral head osteonecrosis—a three-dimensional finite element analysis. T.D.Brown, G.L.Hild (Dept. of Orthopaedic Surgery & Civil Engng., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.171-6 (May 1983). [received: Oct. 1983]
Three-dimensional finite element analysis was used to explore the influence of several lesion characteristics upon mechanical stress distributions in segmentally necrotic human femoral heads. Variables studied parametrically included apparent modulus deficits within the lesion proper, as well as the depth, width, and location of the infarcted head regions. The detailed patterns of stress redistribution were complex and were found to be a strong function of the specific lesion characteristics. The salient phenomenon, however, was one of preferential load uptake by the stiffer bone surrounding the lesion. Since computed stress reductions within the infarctions were usually much smaller than experimentally observed strength reductions, the data suggest a strong tendency for an elevated incidence of trabecular fatigue fractures in the affected regions. (23 refs.)

120945 Measurement of turbulence intensity in the center of the canine ascending aorta with a hot-film anomometer. T.Yamaguchi, S.Kikkawa (Dept. of Surgical Sci., Heart Inst. Japan, Tokyo Women's Medical Coll., Tokyo, Japan), T.Yoshikawa, K.Tanishita, M.Sugawara.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.177-87 (May 1983). [received: Oct. 1983]
The blood flow velocity near the central axis of the canine ascending aorta was measured with a hot-film anemometer. The cordiac output and the heart rate were controlled at will by means of an extracorporeal circulation and by atrial pacing. The turbulent component of the blood flow velocity was calculated using an ensemble average technique. Ensemble average turbulent intensity was also calculated to show the time course of turbulence in the aorta. The ratio of the mean turbulence intensity to the time mean sectional average velocity in the aorta was constant in most animals regardless of the changes in fluid mechanical parameters. The correlation between the frequency parameter and the relative mean turbulence intensity was weakly positive. The power spectrum of the turbulence was also calculated. (32 refs.)

120946 Poisson's ratio and incompressibility. D.L.Vawter (Dept. of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.194-5 (May 1983). [received: Oct. 1983]
It is well known that many biological materials are incompressible or at least nearly incompressible. In many earlier analyses incompressibility has been mathematically modeled by prescribing Poisson's ratio to be 0.5. This procedure works only when either the strains are infinitesimal or the stress in the three principal directions are equal. The volume expansion of a material, of course, is a function only of the deformation of the material. The fact that it is simple related to material constants (i.e. Poisson's ratio) for very small strians must be considered fortuitous and cannot be expected in the general case. In this note the authors show that for finite deformation, even if the stress-strain relationship is linear and isotropic, the condition of incompressibility cannot be simply modeled by setting the value of a particular material constant to a predetermined value. Although the authors present results for a linear stress-strain relationship, it is also shown that the foregoing approach cannot work for incrementally linear stress-strain relationships. 87.50 BIOLOGICAL EFFECTS OF RADIATIONS

(inc. effects of fields)

120947 The RBE of the leakage radiation from the Hiletron neutron therapy unit. F.Chen, J.H.Hendry, G.Chu, D.Greene (Regional Dept. of Phys. & Bioengng., Christie Hospital & Holt Radium Inst., Manchester, England), M.Bianchi.
Br. J. Radiol. (GB), vol.56, no.668, p.551-8 (Aug. 1983).
The RBE of the leakage radiation from the Hiletron 14.7 MeV neutron therapy unit has been measured using three sensitive biological systems in mice, which differ markedly in their radiobiological characteristics. These systems comprise type A spermatogonia and bone marrow stem cells, which are affected insignificantly by dose rate, and pigment abnormalities in hair follicles which are affected markedly by dose rate. For mice irradiated at 10 cm depth in a water phantom, the leakage radiation up to 40 cm from the beam axis was virtually as effective as the primary beam for the latter two biological systems, and for spermatogonia in mice when irradiated in air. At this distance, the total dose rate was about 0.2 cGy (rad) per minute (3% of that in the primary beam), and the γ-ray component was about 70%. This equal effectiveness of the total dose for all three systems was considered fortuitous, and it implied high RBE values for equal effect with the small neutron component at far distances. Considering published data on RBE versus neutron energy, the evidence suggested either a positive interaction of neutron and γ-ray components in killing bone marrow stem cells when the neutron component was less than 40% of the total dose, or an increased efficiency of neutrons when delivered at very low dose rates. However the components were additive in killing spermatogonia. (24 refs.)

87.50B Interactions of biosystems with radiations

120948 Role of the physical characteristics of laser radiation in light absorption by haeme-containing biological membranes. V.A.Dubrovskii, V.V.Gusev, O.G.Astaf'eva (Saratov State Medical Inst., Saratov, USSR).
Biophysics (GB), vol.27, no.5, p.953-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.908-9 (1982). [received: Sept. 1983]
Laser radiation is characterized by a high degree of spatial and temporal coherence, spectral density of radiation and polarizability for some types of optical quantum generators. The aim of this work was to identify the influence of these factors on the primary act of the photochemical effect—light absorption. For this purpose the authors made an experimental comparison of light absorption by the haemolysate, oxyhaemoglobin and the enzyme catalase on irradiation with sources of red light with different physical properties. (4 refs.)

120949 Biological aspects of light distribution in scattering media. M.Seyfried, E.Schafer, L.Fukshansky (Univ. Freiburg, Freiburg, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.574-80 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Two models are presented for light propagation in absorbing and scattering media, which are both based on the Kubelka-Munk theory. The models allow, within the general restrictions of the approach, the evaluation of light flux gradients across layered objects with specular reflection at the object boundaries; and the evaluation of optical pathlengths and pathlength distributions for the transmitted, reflected or absorbed light. (9 refs.)

120950 Soft tissue attenuation of acoustic emission pulses. T.M.Wright, J.M.Carr (Dept. of Biomech., Hospital for Special Surgery, New York, NY, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.20-23 (Feb. 1983). [received: Oct. 1983]
The soft tissue attenuation of acoustic emission signals was measured by transmitting pulses through volunteers and measuring the decay of the waveform characteristics of the pulse as a function of the thickness of the interposed tissue. Waveform characteristics of the received signal (signal duration, number of counts, peak amplitude, energy, and rise time) demonstrated an exponential decrease with increasing tissue thickness. The decrease appeared insensitive to the frequency of the pulse within the range of 50 to 600 kHz. (12 refs.)

120951 Changes in myocardial backscatter throughout the cardiac cycle. E.I.Madaras, B.Barzilai, J.E.Perez, B.E.Sobel, J.G.Miller (Dept. of Phys., Washington Univ., St. Louis, MO, USA).
Ultrason. Imaging (USA), vol.5, no.3, p.229-39 (July 1983).
This investigation was performed to identify and quantify systematic variations of myocardial ultrasonic backscatter throughout the cardiac cycle. Using a broadband 5 MHz focused transducer coupled to the epicardial surface of the left ventricle in dogs, backscatter measurements were obtained from each of 7 intervals (windows) of 34 milliseconds duration evenly distributed throughout the cardiac cycle and referenced to backscatter from a steel reflector. Values of integrated backscatter obtained demonstrated a consistent and reproducible pattern throughout the cardiac cycle characterized by elevated values at end-diastole and significantly lower values at end-systole. The average maximum difference was 3.5 dB. (25 refs.)

120952 Ultrasound velocity in fixed human liver: empirical anova and regression modelling on histologically assessed abnormalities. K.P.Zimmermann (Dept. of Electrical Engng., Univ. of Missouri, Columbia, MO, USA), J.C.Smith.
Ultrason. Imaging (USA), vol.5, no.3, p.280-94 (July 1983).
Anova and 'dummy variables' least squares regression methods are used to investigate the dependence of ultrasound propagation velocity on the presence or absence of fat and on the rank ordered level of cirrhosis in fixed human liver. Cirrhosis is found to affect velocity in a nonlinear fashion, while fat depresses the velocities toward lower values. Quantifications of these effects and statistical analyses of their magnitudes are presented. The results represent a contribution toward the empirical understanding of the effects of tissue abnormalities on the velocity of ultrasound propagation in fixed human tissues. (16 refs.)

120953 History and state of the art of quantifying the interaction of electromagnetic fields with biological structures. A.W.Guy (Dept. of Rehabilitation Medicine, Univ. of Washington, Seattle, WA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.781-815 (80 refs.)

120954 Theoretical and numerical methods for quantitfying absorption patterns in man and animal bodies. C.Yeh (Electrical Sci. & Engng. Dept., Univ. of California, Los Angeles, CA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.817-33
Predicting theoretically the total electromagnetic power absorption and distribution of absorbed power in man and animal bodies is one the most challenging and important problems in electromagnetic biological effects research. The author starts with a survey of available analytical/numerical techniques which may be used to treat problems dealing with the interaction of electromagnetic waves and nonspherical three-dimensional dielectric bodies. Then, the two most promising methods are discussed in detail together with several illustrations. Finally, a discussion is presented on the future research prospects in this area. (15 refs.)

87.50C Bioacoustics (sonic and ultrasonic effects on living matter)

120955 Sound levels recorded within the symphony orchestra and risk criteria for hearing loss. E.Jansson, K.Karlsson (Dept. of Speech Communication & Music Acoustics, Royal Inst. of Technol., Stockholm, Sweden).
Scand. Audiol. (Sweden), vol.12, no.3, p.215-21 (1983).
Investigations into noise-induced hearing loss should consist of two parts: a mapping of the sound environment and a charting of hearing loss. This paper is the first part of such an investigation: a mapping of sound levels and sound spectra within the symphony orchestra. It was found that 'heavy' symphonic music exceeds the permitted dose for industrial noise equivalent to 85 dB(A) for a full working week. The permitted noise dose is reached for 'heavy' music after a working time of 10 hours per week in 'exposed' positions, such as in front of trumpets, and after 25 hours in 'normal' positions. A simple method to estimate the 'noise' exposure in equivalent sound level for combinations of different sorts of music has been developed. (5 refs.)

120956 Errors due to signal cutoff in the measurement of sound intensity or sound-pulse dose. W.Kraak (Sektion Informationstech., Tech. Univ., Dresden, Germany).
Z. Elektr. Inf.- & Energietech. (Germany), vol.13, no.4, p.339-48 (1983). In German.
The measurement of sound in studies of the effects of intense sound on the ear, is considered for a particular model of sound pulse. Measurement errors are calculated for a range of insufficient modulation reserves. These errors are expressed as functions of the correct values, distinguishing between quadratic and linear measurement. (6 refs.) *F.Q.*

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

120957 The effect of laser radiation on a dystrophic process in the liver caused by X-ray irradiation. A.K.Polonskii, S.I.Kharlampovich, D.D.Mashchanova, V.B.Potapova.
Med. Radiol. (USSR), vol.28, no.9, p.59-61 (Sept. 1983). In Russian.
A stimulating effect of a helium-neon laser (in single radiation for 5 min. daily) on a reparative process in the liver injured by X-ray radiation (in a single dose of 650) was studied by histological, cytophotometric and electron microscopic methods. It has been shown that after 3-20 sessions of laser therapy the architectonics of hepatic lobules regenerates, by the end of a therapeutic course a nearly complete regeneration of the intracellular structures of hepatocytes is noted. At the same time the level of nucleic acids and glycogen in the latter returns to normal. (7 refs.)

120958 Effect of light on the membrane potential of the cells of Neurospora crassa. T.A.Belozerskaya, M.S.Kritskii, T.V.Potapova, L.M.Chailakhyan (Bakh Inst. of Biochem., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.955-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.910-11 (1982). [received: Sept. 1983]
Reports experiments on the changes in the value of the membrane potential of N. crassa on exposure to light of the blue-violet region. It was found that the membrane slowly hyperpolarised. (10 refs.)

120959 Focus on the non-ionising radiation. J.H.Skotte.
Elektronik (Denmark), no.6-7, p.4-8 (June-July 1983). In Danish.
The article deals with that part of the electromagnetic spectrum described as non-ionising. How such radiation arises, its effect on animals and human beings, which limit values should be used and how such radiation is measured. (no refs.) *H.J.P.*

120960 Sharp resonances in yeast growth prove nonthermal sensitivity to microwaves. W.Grundler (Gesellschaft fur Strahlen- und Umweltforschung, Neuherberg, Germany), F.Keilmann.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1214-167 (26 Sept. 1983).
Microwaves near 42 GHz are found to influence the growth of Saccharomyces cerevisiae. The growth is measured photometrically in stirred aqueous culture. The microwave effect occurs and saturates above a threshold intensity $\ll 10$ mW/cm^2, excluding any explanation based on microwave heating. A surprisingly strong frequency dependence is observed, with resonances as

narrow as 8 MHz. These results confirm the existence of a nonthermal resonant microwave sensitivity in biology; they suggest yet unknown tuned systems triggering yet unknown biological actions. (14 refs.)

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

120961 Effect of X radiation on the number of pulmonary alveolar macrophages. B.Gnatowski, I.Koch (Military Inst. of Hygiene & Epidemiology, Warsaw, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.3, p.151-6 (May-June 1982). [received: Sept. 1983]
Changes in the number and viability of pulmonary macrophages were studied after sublethal doses of X-rays to the whole body or selectively to the chest. A considerable fall in the total number of pulmonary macrophages was observed and the pattern of these changes was different after total body irradiation and after selective chest irradiation. The results suggest the possibility of selective damage by the X-rays to the precursor forms of pulmonary macrophages, and confirm the relationship between the number of pulmonary macrophages and the radiation dose. (14 refs.)

120962 Erythropoietic effect of ultraviolet radiation in blind rats in comparison with control seeing rats. M.Danieyko-Osman, E.Mietkiewski (Dept. of Physiology, Inst. of Physiology & Chem., Pomeranian Medical Acad., Szczecin, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.3, p.169-77 (May-June 1982). [received: Sept. 1983]
In 40 blinded rats erythropoiesis parameters were determined in four groups of 10 animals each and were compared with similar parameters in seeing control rats. Two group of blind rats received ultraviolet radiation 405-289 nm wavelengths; 140000 erg/sec/cm^2 daily for 10 minutes during 2 or 4 weeks. Two other groups served as non-irradiated blind controls. The determined parameters showed the following rise (+) or fall (−) in per cent in relation to the non-irradiation rats: haematocrit (H) +3.6 and 9.3; erythrocyte count (E) +15.1 and 13.2; reticulocyte count (R) +65.5 and 184.1; haemoglobin level (Hb) +6.6 and 13.1; ^{59}Fe incorporation index into erythrocytes (EFe) +27.3 and 30.4, into spleen (SFe) +35.8 and 34.3, into liver (LFe) −20.9 and −19.3, into bone marrow (BFe) −22.8 and −41.9. In the seeing animals all these parameters were significantly greater: H +11.4 and 7.9; E +56.9 and 26.6; R +288.9 and 199.1; Hb +22.3 and 5.1; EFe +64.1 and 42.5; SFe +195.8 and 134.7; LFe −35.4 and −29.9; BFe −65.2 and −57.2. (12 refs.)

120963 Radiation pericarditis following therapy for Hodgkin's disease. G.D.Baisogolov, I.P.Shishkin, I.B.Shapiro.
Med. Radiol. (USSR), vol.28, no.9, p.27-31 (Sept. 1983). In Russian.
Cases of radiation pericarditis among 707 patients with Hodgkin's disease after irradiation of the mediastinum were analysed. In 100 patients irradiation was combined with polychemotherapy in cycles, SORR scheme. Radiation exudative pericarditis was noted in 2.6% of patients. Later on an adhesive process was diagnosed in some patients. Radiation pericarditis was accompanied either by feebly marked signs or no signs at all. In cases of a lingering course (over 24 mos.) of the disease surgical intervention is indicated. The frequency of radiation complications caused by pericarditis depends on the volume of irradiation and, to a lesser degree, on the value of a summary focal dose delivered to the heart within the range of 31-45 Gy. For prevention the heart should be shielded with lead blocks. (23 refs.)

120964 Effect of irradiation on the microviscosity of the nuclear membrane of tumour and liver cells of tumour bearing animals. Ye.L.Mal'tseva, A.N.Goloshchapov, N.P.Pal'mina, Ye.B.Burlakova (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.893-900 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.851-7 (1982). [received: Sept. 1983]
Reports changes in the microviscosity of the nuclear membranes of tumour and liver cells of tumour bearing animals with developing Ehrlich ascites carcinoma (EAC) at different times after exposure to lethal doses (650 R) by the spin probe method. Two nitroxide radicals were used mainly localized in the lipid bilayer and the near protein layers of the membrane lipids. The character and degree of the changes in microviscosity of the various regions of the nuclear membranes indicate the different response to the action of radiation of the cells of organs of the tumour bearers and the tumour both in viscous properties and in change in the lipid:protein ratios. The near-protein lipid layers were found to make an important contribution to the total change in the microviscosity of the nuclear membrane determining the difference in the reaction to radiation of the nuclear membranes of the liver cells of the tumour bearing and healthy animals and also considerable (3 fold) rarefaction of the nuclear membrane of the EAC cells after irradiation. It is shown that the temperature dependence of the rotatory correlation times of both probes is more marked in the EAC cells of the irradiated tumour bearing animals than in the liver. (28 refs.)

120965 Microbubble formation induced in organisms by irradiation. R.Kato.
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.40, p.9-19 (1981).
In this paper radiobiological damage is discussed based on the theory of microbubble formation in an irradiated liquid. Calculations for the size and number of the microbubbles produced in a liquid are applied to those produced in the irradiated organisms. The effect of the micro-radiobiological damage depends on the size and location of the microbubble. The subsequent behaviors of the microbubble after formation in a cell is considered. From the calculations it is concluded that the microbubble formation in organisms by irradiation plays an important role in radiobiological damage. (16 refs.)

(see also 28.80 Nuclear radiation technology, including shielding)

120966 Recent trends of medical image processing. M.Onoe.
Syst. & Control (Japan), vol.27, no.3, p.158-68 (March 1983). In Japanese.
Imaging based on CT technology has become paramount in the medical diagnosis field. X-ray scanning and diagnostic ultrasound equipment have shown impressive growth. Attention has been given to ultrasound tissue characterization, which allows greater accuracy in diagnosing tissue abnormalities. Digital radiography (DR) is becoming popular as a safe, cost-effective X-ray technology and is very suitable for use in angiography on an outpatient basis. DR can reduce the use of coronary cineangiograms and related catheters, etc. Nuclear magnetic resonance (NMR) is a radiationless imaging technique capable of visualizing the metabolic function of an organ (or lack of it) rather than a structure. NMR may become a universal imaging technique. This paper reviews today's aspect and the future trend in very high-speed CT, digital radiography, positron CT, NMR CT and ultrasound imaging. (2 refs.) *K.B.*

120967 Present status of medical imaging apparatus. M.Tsuda, H.Hattori.
Syst. & Control (Japan), vol.27, no.3, p.178-85 (March 1983). In Japanese.
Imaging equipment for medical applications utilizes X-rays, gamma-rays from a radioactive isotope, ultrasonic waves, or nuclear magnetic resonance (NMR). A brief description is given of X-ray television systems, digital fluoroscopy systems, X-ray CT imaging, scintillation cameras, emission CT imaging, ultrasonic equipment, and NMR imaging systems. Digital subtraction angiography (DSA) is establishing itself as a safe, cost-effective X-ray technology that provides physicians with a simplified method of examining blood vessels and the main organs they supply. The technique is noninvasive, requiring no catheterization (only a venous injection). With DSA's resolution continuing to improve coronary imaging will become possible. A combination of ultrasound and electronic scanning provides quantitative, accurate data and may represent the end generation of CT scanning and ultrasonic equipment. NMR is expected to join. The NMR technique holds great promise. (no refs.) *K.B.*

87.60B Sonic and ultrasonic radiation

120968 Noninvasive method for detecting laryngeal narrowing with low-frequency sound. K.Sekizawa, C.Shindoh, W.Hida, S.Suzuki, Y.Akaizawa, Y.Shimizu, H.Sasaki, T.Takishima (First Dept. of Internal Medicine, Tohoku Univ. School of Medicine, Sendai, Japan).
J. Appl. Physiol. (USA), vol.55, no.2, p.591-7 (Aug. 1983).
Laryngeal narrowing was measured with low-frequency sound in human subjects. A low-frequency sound of 800 Hz was forced into the mouth, and sound-pressure amplitude above (SPAa) and below the vocal cord (SPAb) was detected using two separate microphones at the anterior neck. If the subject voluntarily narrowed the larynx at functional residual capacity, the increased respiratory resistance (Rrs) was only caused by increased laryngeal resistance, and SPAa was increased and SPAb was decreased. The percent changes of SPAa (SPAa%) minus that SPAb (SPAb%) from the initial values ($SPAa\%-SPAb\%=Y$) was proportional to the increase of Rrs from the initial control state (X, $cmH_2O.l^{-1}.s$); $Y=22.4\ X^{1.20}$ (coef. of correlation, $r=0.96$, $P<0.01$). The authors confirmed similar proportions in dogs by manually narrowing the vocal chord. When laryngeal resistance was directly measured by tracheal puncture with a needle, the proportions between Y and X were not significantly dependent on the increase of Rrs below the vocal cord induced by methacholine inhalation in human subjects and histamine injection in dogs. It is concluded that the increase of laryngeal resistance from the initial state can be detected noninvasively by using low-frequency sound. (22 refs.)

120969 Sounding the heart. A new acoustic therapy. W.Campbell.
Sci. Dimension (Canada), vol.15, no.4, p.23-7 (1983).
If the right amount of ultrasound energy is applied at just the right time, it can dramatically improve the performance of the heart when it is under stress. Early indications point to the same kind of effect in diseased or failing hearts as well. It is hoped that the ultrasound 'transducer' device, which converts electrical energy into ultrasound, can be used in the future to ease the effects of surgery on the heart. (no refs.)

120970 High speed tympanometry and ipsilateral middle ear reflex measurements using a computerised impedance meter. A.Ivarsson, O.Tjernstrom, A.Bylander, S.Bennrup (Dept. of Otorhinolaryngology, Univ. of Lund, Lund, Sweden).
Scand. Audiol. (Sweden), vol.12, no.3, p.157-63 (1983).
By means of a new computerized impedance meter, middle ear pressure, tympanograms and ipsilaterally elicited middle ear reflex can be recorded and presented in 3 sec. Owing to the fast rate of air pressure change in the external ear canal it is not necessary to have a completely airtight seal around the ear probe when recording middle ear pressure, which saves time. Results obtained using the new device and those obtained by a conventional impedance bridge are compared. (11 refs.)

120971 Comparison of manual and computer-controlled audiometry using identical procedures. L.Jerlvall, H.Dryselius, S.Arlinger (Dept. of Audiology, Univ. Hospital, Linkoping, Sweden).
Scand. Audiol. (Sweden), vol.12, no.3, p.209-13 (1983).
Ten normal-hearing subjects were evaluated with both manual and computer controlled audiometry using the ascending threshold determination method as proposed by ISO. The study shows that the thresholds obtained with the two different techniques correlate well and that standard deviations for the test-retest difference are significantly lower in the computer-controlled situation. The results also indicate that computer-controlled audiometry may be of importance in general clinical applications giving rapid and reliable threshold determination. (7 refs.)

120972 The selection of modulation rates for frequency modulated sound field stimuli. Walker G., H.Dillon (Nat. Acoustic Labs., Sydney, Australia).
Scand. Audiol. (Sweden), vol.12, no.3, p.151-6 (1983).
Frequency modulated (FM) tones are used in sound field audiometry in order to avoid problems caused by standing waves. The FM stimuli to be used must be specified in terms of bandwidth (twice the frequency deviation), modulation rate and modulation waveform. This paper deals with selection of the modulation rate. Improved field uniformity obtained with FM tones relies upon the ear avaraging the sound intensity as the frequency sweeps. The modulation rate must be less than about 1/3 of the frequency deviation in order to provide sufficient spectral components to ensure reasonable averaging across the frequency band. If the rate is too low threshold will be determined

by the peak intensity during the sweep. For normal listeners a modulation rate of 5 Hz is just satisfactory but in the hearing impaired a higher rate is required because of their altered temporal integration characteristics. A suitable value for the modulation rate can be inferred from the literature on temporal integration and the acoustic characteristics of typical test rooms. The optimum rate increases with the stimulus centre frequency, but a constant rate of 20 Hz appears to be acceptable. (17 refs.)

120973 Generation of separate density and compressibility images in tissue. S.J.Norton (Center for Materials Sci., NBS, Washington, DC, USA).
Ultrason. Imaging (USA), vol.5, no.3, p.240-52 (July 1983).
A method is suggested for reconstructing separate images of the variations in density and compressibility in the same tissue sample. The images can be obtained from near-field scattering measurements using only two long, rectangular transducer elements. As in diffraction tomography, 180° access around the region of interest is required. This approach differs from conventional diffraction tomography, however, in that no transducer arrays are required and broadband illumination is used. A flat transducer, assumed long relative to the extent of the object, is used as a source of broadband, plane-wave illumination, and as a receiver of the backscattered sound. A sound transducer, oriented at a different angle with respect to the first, is used as a receiver only. The two transducers are rotated together 180° around the object, and the scattered sound is recorded at all angles during the rotation. This arrangement can be shown to sample the plane-wave spectrum of the object directly, and provides sufficient information to reconstruct independent images of the variations in both the density and compressibility of the scattering medium. Image resolution is limited by the bandwidth of the illuminating sound. (13 refs.)

120974 Real time ultrasonic imaging with arrays. J.G.Abbott, K.E.Thomenius (Elscint Inc., Boston, MA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.15-1/1-6
The history and present use of array system technology for real-time ultrasonic imaging in a medical environment is discussed. Array systems presented include the wide aperture switched linear array, the electronically steered and focused phased linear array and the mechanically steered, electronically focused annular array. Practical and theoretical advantages and disadvantages of each approach are compared and the unique problems of implementation of each are presented. This analysis concludes with a brief discussion of future real-time array imaging modalities. (30 refs.)

87.60D Electric and magnetic fields (d.c. and pulsed)

120975 A new magnetic method for studying the quality of lung-retained dust in vivo. K.Kalliomaki, P.-L.Kalliomaki, M.Moilanen.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.72-5 (1983).
Workers in the metal industry are exposed to fumes which nearly always contain iron (magnetite). If the worker's exposure is homogeneous the amount of lung-retained dust can be estimated from the remanent magnetic field of the dust after the chest area has been magnetized. In most cases, however, the worker's exposure is heterogeneous. For example, a welder often uses several welding methods that generate fumes which differ from each other. Then the old measuring method does not reliably reveal the actual character of the contaminants retained in the lungs. By utilizing pulse magnetization and demagnetization, one can measure the pulse coercive force of the lung retained contaminants. The results of preliminary measurements showed that stainless steel workers can be divided into three groups, i.e. the quality of the dominating lung retained contaminants can be determined with the aid of the pulse coersive force. (4 refs.)

120976 Diagnostic potential of magneto-photoacoustic spectroscopy. R.Carey, D.M.Newman, B.W.J.Thomas (Dept. of Appl. Phys., Coventry Polytech., Coventry, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.35-40 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Describes a magneto-photo-acoustic spectroscopic (MPAS) technique which the authors claim will prove to be more sensitive than the reflectivity measurements of Sato et al. (1981) in sensing the presence of malignant diseases in blood. The authors begin by describing the magnetic properties of blood cells, illustrating how the combined expertise of magneticians and haematologists has been successfully applied to the problem of red blood cell separation. The authors then briefly review the reported application of PAS to medical problems including the spectral analysis of whole blood, and finally the authors present the details of preliminary experimental measurements on the MPAS signal from whole blood at the He-Ne wavelength. (8 refs.)

120977 Eye deformation measurement by laser interferometry. A.F.Fercher, J.D.Briers (Univ. of Essen, Fachbereich Phys., Essen, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.42-4 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A new interferometric technique to measure deformations of the eye in vivo is described and its application to the diagnosis of glaucoma is discussed. (6 refs.)

120978 Double pulsed holographic interferometry on human beings in vivo. M.H.De Caluwe, P.M.Boone (Lab. for Strength of Materials, Univ. of Ghent, Ghent, Belgium).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.596-603 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The use of a pulsed ruby laser in recording holographic interferograms of specific surface displacements of the human body is demonstrated. Technical particularities of the technique are discussed and attention is paid to the safety requirements of the measurement method. (15 refs.)

120979 Non-invasive microwave monitoring of respiratory pattern. N.Ambrosino (School 'Terapisti della riabilitazione', Pisa, Italy), M.Bramanti.
J. Med. Eng. & Technol. (GB), vol.7, no.5, p.224-7 (Sept.-Oct. 1983).
A non-invasive system for monitoring chest and abdominal motion is described. The system is based on the use of two microwave interferometers. A linear relationship with tidal volume can be obtained using an isovolume technique for calibration. Although the system is not an improvement on existing equipment, it is simpler and cheaper and well suited to rehabilitation work. (20 refs.)

120980 A variable pulse-burst electromagnetic generator for electrical stimulation of biological systems. G.N.Reddy, S.Saha (Dept. of Orthopaedic Surgery, Louisiana State Univ. Medical Center, Shreveport, LA, USA).
J. Biomed. Eng. (GB), vol.5, no.4, p.336-9 (Oct. 1983).
A variable frequency-burst type, electromagnetic pulse generator has been developed to optimize the effect of electrical stimulation on bone growth. Using a pair of coils, with 100 turns and 18-gauge wire, the instrument can generate a maximum magnetic field of 300 Gauss. Its pulse repetition frequency can be varied from 10 Hz to 2 kHz and the duty cycle, consisting of several short carrier frequency pulses, can be varied up to 95%. This design also permits the period of the carrier pulse to be changed. (16 refs.)

120981 Nuclear magnetic resonance blood flow measurements in the human brain. J.R.Singer, L.E.Crooks (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).
Science (USA), vol.221, no.4611, p.654-6 (12 Aug. 1983).
Timed sequences of nuclear magnetic resonance imaging signals in the human head were used to quantitatively measure blood flow in the internal jugular veins. The procedure can be straightforwardly applied to any vein or artery in the body. (11 refs.)

120982 Nuclear magnetic resonance imaging: an overview. I.L.Pykett (Dept. of Radiology, Massachusetts General Hospital, Boston, MA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.15-2/1-3
Today's 'state-of-the-art' NMR images compare favorably with X-ray computerized tomography (CT) scans, especially in terms of soft tissue contrast resolution; the next few years will undoubtedly witness a rapid expansion of its applications to clinical practice. One particular advantage of NMR imaging over X-ray CT is that it is inherently a three-dimensional technique. (10 refs.)

120983 A microscope-television system for online measurement of blood flow velocity in microvessel using an adaptive window. Jin Qi Yin, Zhang Ju Peng, Zhang Zhi Guang, Liu Ting Wen, Tang Yu, Wang Zhong Rui, Zhong Kong De (Dept. of Electrical Engng., Tsinghua Univ., Beijing, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.327-37
A system which is used for on-line measurement of the blood flow velocity in microcirculation is introduced. The system is characterized by an adaptive window which coincides with the microvessel to be tested. Two ways of measuring the blood velocity are analog processing method; and digital correlation method. About a hundred cases of clinical experiment have been carried out which show that this system is very useful for the study of microcirculation. Simulation test for blood flow indicates that the linearity error of the system is less than 5% and the velocity can be measured over a range of 0-4 mm/sec. (6 refs.)

120984 Medical diagnosis and imaging using electromagnetic techniques. M.F.Iskander, C.H.Durney (Dept. of Electrical Engng., Univ. of Utah, Salt Lake City, UT, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.835-54
Presents a brief review of the potential electromagnetic (EM) methods for medical diagnosis and imaging. This includes electrical impedance methods, microwave methods for measuring lung water content, and electromagnetic imaging. The principles underlying the operation of each method are described along with comments about their adequacy for medical diagnosis. It is shown that while the microwave method was introduced to overcome some of the limitations of the electric impedance method, its potential to estimate the absolute value of the average lung water content still needs further research. Electromagnetic imaging, on the other hand, is expected to overcome some of the difficulties involved in the microwave method. The important theoretical and experimental results that identify the advantages and the limitations of each method are presented. Suggestions for future development and for possible extensions are discussed. Furthermore, other techniques such as microwave radiometry, the electromagnetic flowmeter, and use of microwave Doppler radar to monitor arterial wall movement, are briefly mentioned. (36 refs.)

120985 Medical therapy with π^- mesons. E.Walder (Schweizerisches Inst. fur Nuklearforschung, Schweiz, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.165-8 (1983).
Physical and biological aspects led to the realization of cancer therapy with π^- mesons. The pions are produced by collision of the protons with target material. They are focused into the treatment volume. Two methods are developed to scan this volume in a 3-dimensional way. The dosimetric system has to take into account that the dose contains spatially mixed LET contributions. CT-slices of the patient serve as a basis for therapy planning. As experience grew, deeper lying tumors were treated. The expectations of the project have recently beeen accomplished. Even so, it is too early to make conclusive statements about clinical data; however, the results permit one to look optimistically into the future. (12 refs.)

120986 Computer-aided tomography in the determination of lung density in irradiation planning. K.Merkle, O.N.Spasokukotskaya, S.E.Evdonin.
Med. Radiol. (USSR), vol.28, no.9, p.31-4 (Sept. 1983). In Russian.
Considers the problems of the determination of lung density in irradiation planning for thoracic tumors using CT. A mean value of density of 0.252 ± 0.118 g/cm^3 was obtained from a study of 118 CT lung scans during quiet breathing. The density was 0.162 ± 0.022 g/cm^3 in deep breathing and 0.282 ± 0.050 g/cm^3 in full expiration. The values of lung density varied in different persons. The range of measured values was 0.119-0.441 g/cm^3 in quiet breathing. The values of lung density varied within one scan from a minimum value in its front part to a maximum one in the rear part. To determine lung densities that are representative for radiation therapy, the authors conclude that CT should be performed with a patient breathing quietly in an uninterrupted manner. (12 refs.)

120987 Radionuclide studies on ventilation and perfusion in different lung regions. A.I.Sorokin, B.Ya.Narkevich, Yu.B.Bogdasarov, T.I.Zaitseva.
Med. Radiol. (USSR), vol.28, no.9, p.42-7 (Sept. 1983). In Russian.
At present when using radionuclide methods for investigation of lung ventilation and blood flow one mistakes either a regional ventilated volume or the rate of indicator clearance from a given region for regional alveolar ventilation. The regional ventilation-perfusion ratio is obtained by dividing corresponding values expressed not in absolute but in relative units that causes erroneous results. A method proposed in this paper makes it possible to calculate regional distributions of ventilation, perfusion and their ratio in terms of values of the mean time of the passage of an indicator through the alveolar-bronchial space and the vascular bed of the lungs, strictly in accordance with the conditions of the clinical physiology of respiration. Measurements are taken according to an established method using either a γ-chamber or a radiographic unit with autonomous detectors. (10 refs.)

120988 A phantom to assess quantitative recovery of positron tomographs. B.E.Cooke, A.C.Evans (Atomic Energy of Canada Ltd., Kanata, Ontario, Canada).
J. Comput. Assisted Tomogr. (USA), vol.7, no.5, p.876-80 (Oct. 1983).
A simple phantom has been employed to investigate the image linearity for a wide range of activity distributions and count rates. The phantom is composed of two activity regions, one contains a short-lived isotope and the other a long-lived isotope. Specifically, the phantom consists of a 20 cm flood phantom containing ^{68}Ga (half-life 1.14 h) into which a 6 cm diameter cylinder containing ^{64}Cu (half-life 12.7 h) is placed in an off-centre position. The copper region is initially a cold spot but, after many gallium half-lives, becomes a hot spot. Successive data sets from the phantom are taken over a long period and the reconstructed images analysed to establish the linearity within each region and hence the stability against 'cross-talk' from neighbouring regions. (9 refs.)

120989 Artifact simulating chronic extracerebral fluid collections on computed tomography of the head. T.T.Loh (Dept. of Radiology, St. Vincent Hospital & Medical Center, Toledo, OH, USA).
J. Comput. Assisted Tomogr. (USA), vol.7, no.5, p.925-7 (Oct. 1983).
Accurate analysis in computed tomography of the brain requires recognition of artifacts that may lead to an erroneous diagnosis or at least confuse the examination. An artifact that mimics chronic extracerebral fluid collections is described; it can occur with the Picker 600 scanner. One should be aware that an artifact can be machine specific, depending on the reconstruction and design differences of the scanner. (4 refs.)

120990 Tungsten anode tubes with K-edge filters for mammography. S.Beaman, S.C.Lillicrap (Wessex Regional Medical Phys. Service, Bath, England), J.L.Price.
Br. J. Radiol. (GB), vol.56, no.670, p.721-7 (Oct. 1983).
Filters having absorption edges at appropriate energy positions have been used to modify the shape of tungsten anode spectra to bring them close to the calculated optimum. The suitability of such spectra for practical use has been assessed by comparing both the film image quality and the incident breast dose obtained using a K-edge filtered tungsten anode tube with that obtained using a molybdenum anode tube. Image quality has been assessed both by using a 'random' phantom and by comparing mammograms of women attending a screening clinic where one breast was radiographed using a filtered tungsten anode tube and the other using a standard molybdenum anode unit. Relative breast doses were estimated. The film image quality assessment indicated that the filtered tungsten anode tube gave results which were not significantly different from those obtained with a molybdenum anode tube for a tissue thickness of about 4 cm and which were better for larger breast thicknesses. The dose could be reduced to between one-half and one-third with the filtered tungsten anode tube. (15 refs.)

120991 Preliminary clinical images from a prototype positron camera. R.J.Ott, J.E.Bateman, A.C.Flesher, M.A.Flower, M.O.Leach, S.Webb, O.Khan, V.R.McCready (Inst. of Cancer Res., Sutton, England).
Br. J. Radiol. (GB), vol.56, no.670, p.773-6 (Oct. 1983).
Presents preliminary clinical images taken during an evaluation of a prototype multiwire proportional chamber positron camera. Although these early images were taken with a limited sensitive area, a camera with a larger field of view is currently being developed. Such a positron camera would be used with generator-produced as well as cyclotron-produced longer-lived positron emitting radionuclides to provide a PET system at a price competitive with present day gamma camera/computer systems. The small useful sensitive area of the prototype positron camera only enabled limited regions of the body to be imaged. However, it proved possible to produce satisfactory images of these limited regions of the torso. The detector proved most suitable for imaging the skull, brain, thyroid and limbs. (6 refs.)

120992 Real time digital intravenous angiography. J.P.Marc-Vergnes, B.Thiesse (Centre Hospitalier Univ. Purpan, Toulouse, France), M.Adelantado, M.Ducos de Lahitte, P.Marthon, A.Bruel.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.136-40 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
As the computer technique, the CT scan, has recently induced great changes in both medical and radiological practice, photoelectronic detection of X-rays and digital image processing are just beginning to improve angiocardiography. The first generation of intravenous angiography systems is presently available. They allow one to visualize the chambers of the heart as well as the great arteries using a fast intravenous injection of contrast medium. In the future, this technique will probably be suitable for visualizing the entire vascular network, including small arteries and veins, and other cavities such as urinary and digestive tracts. In the long term, a large increase in computer assisted diagnostic techniques is likely to occur, as well as the suppression of the film support. (8 refs.)

120993 Acquisition of organ slice images in nuclear medicine by the multiple-incidence technique. B.Danet, A.Hatzigiannaki (Service de Biophys. et Medecine Nucleaire, Hopital Purpan, Toulouse, France), M.Percheron, J.P.Morucci, R.Guiraud.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.141-7 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
In the development of devices to represent the three-dimensional structure of radio-activated organs, nuclear medicine has been following the progress in radiology. The multiple-incidence technique, the 3D reconstruction being extracted from the whole set of projections of the object at different orientations, is close to the principle used in radio-tomo-densitometry. A detector obtains a set of projections as it turns around the object. From these projections, the classical reconstruction algorithms can be used: ART, SIRT, convolution algorithms. One has to take into account here some more specific properties: the statistic noise, the selfattenuation of the radiation, the distance-dependent resolution. Some correction processes are considered which can be more or less easily implemented depending on the algorithm used. Different compromises can be proposed: they depend strongly not only on the algorithm and the data-processing but also on the detector performance. (13 refs.)

120994 Numerical method of 'adapted' deconvolution: application to the tomography by coded aperture. P.Marthon, P.Bon, A.Bruel (LSI, Univ. Paul Sabatier, Toulouse, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.148-53 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
The discrete formulation of a coded-aperture image is recalled; the principle of the numerical convolution is given and then a maximum value is calculated for the quadratic error. The advantages offered by a post-deconvolution filtering as well as by an iterative restoration of the slices are shown. Finally the results obtained by reconstructing an object consisting of three slices which is a coarse model of the human heart are presented. (5 refs.)

120995 Computer generated 3-D display of X-ray computed tomographic volume image data. L.D.Harris, E.L.Ritman, R.A.Robb (Dept. of Physiology and Biophys., Mayo Clinic and Mayo Found., Rochester, MN, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.176-81 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
The use of two computer-based, multi-dimensional display methods to efficiently convey three-dimensional (3-D) anatomic information contained within computed tomographic (CT) volume images is described. The term volume image refers to a stack of discrete 2-D CT images and is therefore a 3-D array of volume picture elements (voxels). The first display method is referred to as a direct display approach because it directly represents the 3-D volume image array as a 3-D distribution of brightnesses, i.e. each voxel is a brightened point in space. The second display method is referred to as a transformed display approach meaning that before display, the volume image data are transformed resulting in a new image data set which then forms the basis of the display process. An example of transformed display is shaded surface display, where the transformation is the detection and subsequent representation of the 'surface' as a 3-D distribution of reflectors. These display approaches facilitate the direct visualization of 3-D shapes and spatial relationships thereby obviating the necessity of mentally reconstructing shapes from the series of cross sections. (9 refs.)

120996 Attainment of 3-D images in nuclear medicine by coded-aperture devices. D.Lefkopoulos, B.Danet, J.B.Guilhem (Service de Biophys. de Medecine Nucleaire, Hopital Purpan, Toulouse, France), J.P.Morucci, R.Guiraud.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.188-94 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
After a quick survey of previous papers on coded-aperture work in nuclear medicine, the authors present the first results they have obtained with a code originating from the Fresnel zoned array—the Fresnel zoned linear array—the numerical simulation of the diffraction phenomena being used as the reconstruction method. In the case of the circular Fresnel zoned array the numerical reconstruction necessitates a two-dimensional Fourier-transform. On the contrary the Fresnel linear array necessitates a Fourier transform in one dimension only; so it becomes possible to use this method with the processing equipment frequently available in nuclear medicine facilities. The experimental results obtained have allowed the focusing-properties of this code (tomographic effect) to be verified and also to show that the values obtained by numerical reconstruction agree with those given by the theory of optics. (24 refs.)

120997 Study of methods of 3-D reconstruction in radiography. F.Peyrin, P.Wetta, R.Goutte, M.Amiel (Lab. de Traitement du Signal et Ultrasons, INSA de Lyon, Villeurbanne, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.208-15 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
In the field of X-ray radiography, different three-dimensional reconstruction techniques have been proposed: apart from computer-aided tomodensitometric methods one can reconstruct an object by using the different slices which are obtained by the now classic scanner. Nevertheless, it is also possible to consider that problem more directly, by using a set of planar projections. In the parallel-beam geometry a set of projections obtained by the rotation of the beam in a plane is sufficient to reconstruct the 3-D object. This method meets technological difficulties as it is difficult to have a parallel-beam with a large cross-section. This fact has led the authors to consider the use of a conical beam. This causes further technological and practical difficulties due to the generally limited possibilities in the positioning and the displacement of the X-ray sources. One is thus inevitably led to use measurements originating in a

system based on the cone-beam geometry whose axis rotates only in one plane. Thus, this axial symmetry will cause a certain number of problems which are in fact the consequence of the limited knowledge of the information. Possible solutions are suggested. (18 refs.)

120998 Study of optimal reconstruction techniques in the field of X-ray tomodensitometry of the heart. P.Wetta, F.Peyrin, R.Goutte, M.Amiel (Lab. de Traitement du Signal et Ultrasons, INSA de Lyon, Villeurbanne, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.216-29 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
Computerized-aided tomodensitometry by X-rays is a powerful, precise and noninvasive tool to investigate the human body as well as different objects and structures. The relatively long examination time, from 2 to 10 sec., which the present state of the art necessitates, limits the field of applications of this tool to static on quasistatic organs or objects (e.g. the brain or abdomen in medical diagnosis). When one tries to reconstruct images of a dynamic object some errors or artefacts appear. In the case of the heart, in particular, the examination time takes several cardiac periods; so, the reconstructed image is highly blurred and for all purposes unusable. One solution, which can be used with a conventional scanner, is the 'gating' technique. Taking into account the repetitive property of cardiac movement, this technique necessitates catching the projections in synchronization with the electrocardiogram. Thus a subprogram, controlled by the ECG signal, has to select a set of projections corresponding to a certain time of the cardiac period. The authors discuss the methodology used to acquire the projections, the problems caused by the small number of projections, some mathematical solutions (extensions of signals and data, interpolations, uses of the redundancy in the information given by a FAN-BEAM system). The different possibilities are illustrated by results obtained in experiments on animals with a FAN-BEAM machine. (4 refs.)

120999 Radiation risk of thyroid scintigraphy in newborns. H.Beekhuis, D.A.Piers (Dept. of Nuclear Medicine, Univ. Hospital, Groningen, Netherlands).
Eur. J. Nucl. Med. (Germany), vol.8, no.8, p.348-50 (1983).
Tumor risk factors were calculated for newborns who were investigated for congenital hypothyroidism (CHT) with radionuclides by thyroid scintigraphy. Figures for three radiopharmaceuticals, ^{99m}Tc-pertechnetate, ^{123}I- and ^{131}I-sodium iodide for adults were extrapolated to newborns. The radiation dose to the normal thyroid gland in newborns was seven times higher for ^{123}I-NaI than for $^{99m}TcO_4^-$, the somatically effective total body dose was two times higher for ^{123}I-NaI than for $^{99m}TcO_4^-$. The use of ^{123}I-NaI was preferred because of better scintigraphic results. Risk estimates for thyroid scintigraphy in newborns in the diagnostic work-up of CHT are given using published age-dependent tumor induction figures derived from atomic bomb survivors. (15 refs.)

121000 A method of quantitative ^{67}Ga scintigraphy in the evaluation of pulmonary sarcoidosis. J.G.van Unnik, E.A.van Royen, C.Alberts, J.B.van der Schoot (Dept. of Nuclear Medicine, Univ. of Amsterdam, Amsterdam, Netherlands).
Eur. J. Nucl. Med. (Germany), vol.8, no.8, p.351-3 (1983).
^{67}Ga scintigraphy was performed in 42 patients with pulmonary sarcoidosis and in 30 control subjects. Accumulation of the radionuclide in hili and lungs was quantified by a computer method. The values in control subjects were found to be within a relatively narrow range. The pattern of ^{67}Ga accumulation clearly differed in patients who were radiographically defined as having only lymphadenopathy and in patients also having parenchymal involvement. Corticosteroid therapy resulted in a sharp decline of values of isotope uptake, although hilar activity remained slightly elevated. The quantitative uptake measurement proved to be superior to a subjective scoring method. (8 refs.)

121001 Quantitative, non-invasive cerebral blood flood flow measurements with non-diffusible tracers using a heart-rate-dependent recirculation correction—application in carotid surgery. P.Lindner (Municipal Hospital Passau, Dept. of Radiology, Passau, Germany).
Eur. J. Nucl. Med. (Germany), vol.8, no.8, p.358-63 (1983).
A general method is described for computation of blood flow from time-activity curves using intravenous injection of the non-diffusible radio-tracer technetium pertechnetate. A technique of recirculation correction is adopted which predicts the start and end of recirculation depending on the patient's heart rate. This method allows one to clearly separate the first transit from the following recirculation. A correction for bolus dispersion of the intravenously injected tracer is also used. The evaluation of cerebral dynamic perfusion studies in 126 unselected adult patients resulted in a normal CBF of 44.5 ml/min/100 g±5% and a decreased CBF of less than 40 ml/min/100 g. The method presented was also applied for flow measurement on the neck vessels. A good correlation between values obtained from these regions and the corresponding cerebral hemispheres, was found. The method was also tested in 40 patients with angiographically proven neck vessel stenosis and in 15 patients before and after surgery of carotid stenosis. The results prove that the haemodynamic relevance of carotid stenosis on cerebral blood flow can be quantified. (16 refs.)

121002 Comparative CT examination of the anterior crucial ligament in direct projection and by means of sagittal reconstruction. K.Meydam, M.Kessler, R.Muller-Rensing, G.Fund (Abteilung fur Radiologie des Knappschafts-Krankenhauses, Dortmund, Germany).
Roentgen-Bl. Prax. & Klin. (Germany), vol.36, no.8, p.244-7 (Aug. 1983). In German.
Presents an indirect method for the visualization of the anterior crucial ligament, using the method of sagittal reconstruction. Positioning in the so-called tailor's seat is often impossible in freshly injured persons. The abdominal positioning described in this article, with external rotation of the leg, is tolerated by almost all patients. Sagittal reconstruction yields adequate information in fresh lesions and if there is an obstruction to bending. However, this method is diagnosticaly not as infallible as direct visualization. The authors discuss whether additional reconstructions on different planes and with pixels of different thickness (so-called thick pixel reconstruction) may be able to contribute to improved diagnostic results in future. In addition, the authors compare their own examination results with normal and pathological findings published by other authors. (12 refs.)

121003 Standardization of ^{18}F for use in positron-emission tomography. B.M.Coursey, D.D.Hoppes, M.P.Unterweger (Radioactivity Group, NBS, Washington, DC, USA), A.Grau Malonda, R.A.Margolin, R.M.Kessler, R.Manning.
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1181-9 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Fluorine-18 has been standardized using three counting systems: (i) the NBS pressurized '4π'γ ionization chamber, (ii) a $4\pi\beta$ liquid-scintillation counter, and (iii) a Ge(Li) gamma-ray spectrometer previously calibrated with sodium-22. The results of the three measurements agreed to within 1 percent. Solution standards of fluorine-18 were used at the NIH to calibrate counting systems used in positron-emission tomography for nuclear medicine. (5 refs.)

121004 A conceptual design of neutron tumor therapy reactor facility with a YAYOI based fast neutron source reactor. H.Wakabayashi (Nuclear Engng. Res. Lab., Univ. of Tokyo, Tokyo, Japan), S.An.
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.37, no.1, p.123-33 (March 1983). [received: Oct. 1983]
Fast neutrons are known as one of the useful radiations for radiation therapy of tumors. Boron neutron capture therapy (BNCT) of tumors which makes use of $^{10}B(n,\alpha)^7Li$ reaction of ^{10}B compounds selectively attached to tumor cells with thermal and intermediate neutrons is another method of neutron based radiation therapy which is, above all, attractive enough to kill tumor cells selectively sparing normal tissue. In Japan, BNCT has already been applied and found to be effective. A conceptual design of a special neutron therapy reactor facility based on YAYOI—fast neutron source reactor of Nuclear Engineering Research Laboratory, Faculty of Engineering, the University of Tokyo—modified to provide an upward beam of fast and intermediate neutrons is presented. Emphasis is placed on the in-house nature of the facility and on the coordinating capability of biological and physical researches as well as maintenance of the facility. (9 refs.)

121005 Large format X-ray image intensifier for lung investigations. R.Frank, F.W.Hofmann, S.Schweda (Siemens AG, Erlangen, Germany).
NTG-Fachber. (Germany), vol.85, p.176-81 (1983). In German. (Elektronenrohren (Thermionic Valves), Garmisch-Partenkirchen, Germany, 18-20 May 1983).
The new Siemens electron-optical X-ray tube has a 57 cm input field diameter, allowing lung imaging with minimum irradiation; it is suitable for the indirect method. The design of the tube, its vacuum enclosure, X-ray transparent window and projection with 5.7:1 reduction are described in some detail. The amplification is sufficient to expose a 100×100 mm^2 film with an irradiation of 100 μR. Some performance data are given. (5 refs.) *J.M.S.*

121006 Pions against cancer. New tumour therapy at UBC. B.Atkinson.
Sci. Dimension (Canada), vol.15, no.4, p.12-16 (1983).
TRIUMF, a great cyclotron in Vancouver supported by NRC, is now producing a different kind of radiation for use against cancer. TRIUMF accelerates hydrogen ions to respectable fractions of the speed of light. At one point in the spiral these ions describe during their acceleration, TRIUMF's technicians have positioned a thin piece of metal foil which strips the electrons from some of the fast-moving ions, changes their charge, and sends them hurtling along a pipe at a tangent to their prior spiral course. Halfway down this pipe the particle beam, now composed of pure protons, smashes into a target of carbon or beryllium and produces pions. These pions continue the rest of the way down the pipe to the treatment centre and irradiate patients with deep tumours of the pelvis or brain. Pions have what is called a 'depth-charge effect'—they cause less damage than conventional radiation does to intervening healthy cells, yet deliver up to 40 per cent more energy at the tumour site. Essentially, one first calculates the exact point where the pi-mesons will become unstable enough to react strongly with surrounding matter and positions the patient carefully where the pions will 'emerge'. Patients are exposed to the pion beam for only twenty minutes at a time. Given the beam's intensity, this duration is quite safe; the time limit is imposed not by radiation hazard but by the patients' comfort. (no refs.)

87.60L Preparation of radioactive materials for medical and biomedical uses

121007 Accelerator production of medically useful radionuclides. G.Pfeiffer (Inst. fur Reaktorforschung, Wurenlingen, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.169-73 (1983). In German.
The production of radionuclides in accelerators has become of increasing importance during the last years, because these nuclides fulfil the demands for tracers as they are used for diagnostic purposes. Most of them are produced by bombardment with hydrogen or helium nuclei in cyclotrons. The kind of particles, their energy and the beam intensity determine the production rate. Some of these radionuclides are already used for routine work in the departments of nuclear medicine (^{67}Ga, ^{201}Tl), others will be applicable soon (^{81m}Kr, ^{127}Xe). One of the most versatile radionuclides is ^{123}I since it qualifies for labelling many substances of medical concern. Since 1975 it is permanently produced in abundance in Switzerland. (19 refs.)

87.60M Radiation dosimetry

121008 Dosimetric characteristics of ^{125}I encapsulated sources for interstitial radiation therapy. A.A.Volkov, O.N.Pereletov, R.V.Sinitsyn, V.M.Zaitsev, E.G.Alekseev, S.M.Vatnitskii, I.S.Osipov.
Med. Radiol. (USSR), vol.28, no.9, p.68-70 (Sept. 1983). In Russian.
Thermoluminescent dosimetry using Mix-D material was applied to study the dosimetric characteristics of discrete sources in the form of titanium and nylon capsules, sizes 0.8×2.5 and 1.7×7 mm, with an activity of 20-40 MBK. Dose field parameters were permissible within the limits of volume subject to radiotherapy. There was a higher dose gradient beyond the field

limits as compared to ^{226}Ra, ^{198}Au and ^{192}Ir. It is concluded that manufactured ^{125}I discrete sources meet the requirements of interstitial radiation therapy in the protracted tumor irradiation mode. (2 refs.)

121009 Gastrointestinal fluoroscopy: patient dose and methods for its reduction. S.J.Leibovic, W.J.H.Caldicott (Dept of Radiology, Children's Hospital, Boston, MA, USA).
Br. J. Radiol. (GB), vol.56, no.670, p.715-19 (Oct. 1983).
Demonstrates a method which could be used to identify factors which contribute to the radiation exposure to patients from fluoroscopy during contrast examinations of the gastrointestinal tract. Measurements of exposure made at the level of the X-ray tube collimator were extrapolated to obtain entrance exposure at the centre of the field and used as an index of the integral dose to the patient. Such data have heretofore been unavailable. The population studied included 65 patients ranging in age from 1 month to 21 years. The results of an initial study are reported. The authors recommend modifications in the operation and design of fluoroscopic equipment, especially when fitted with brightness and exposure controls, for the reduction of patient exposure. Implementation of two modifications, a high/low dose switch, and a variable aperture iris diaphragm, reduced patient exposure from 1.4 to 3.4 times. (12 refs.)

121010 Occupational exposure in medicine—a review of radiation doses to hospital staff in north-west England. J.S.Hughes, G.C.Roberts (Nat. Radiological Protection Board, Chilton, England), S.K.Stephenson.
Br. J. Radiol. (GB), vol.56, no.670, p.729-35 (Oct. 1983).
The personal monitoring service operated by the Regional Physics Department at the Christie Hospital and Holt Radium Institute, Manchester, monitors staff involved with the uses of ionising radiations at all hospitals and clinics administered by the North Western Region Health Authority in England. Monitoring results relating principally to exposure during 1981 have been collated and examined. The analysis indicates that the doses received by staff are for the most part very low and provide little reason for concern. The only area of work in which worthwhile and cost-effective dose reductions could probably be achieved is that involving the use of pre-loaded applicators in gynaecological intra-cavitary therapy. Some relatively high staff exposures result from the use of this technique, and very significant reductions in these doses are confidently expected from a programme which has now commenced for the increasing use of remotely-controlled afterloading equipment housed in shielded treatment rooms. (7 refs.)

121011 A refinement to a radiation dose reduction modification for an EMI CT 5005 whole body scanner filtration system. K.Cranley, J.A.C.Webb, T.K.Bell (Regional Medical Phys. Service, Royal Victoria Hospital, Belfast, N Ireland).
Br. J. Radiol. (GB), vol.56, no.670, p.770-2 (Oct. 1983).
A modification to the aluminium wedge filtration system of an EMI CT 5005 scanner, providing considerable dose reduction, has recently been reported (Webb et al., ibid., vol.55, p.634-9, 1982). This consists of a pre-patient copper filter and a post-patient dummy wedge as a replacement for the post-patient aluminium wedge which is normally used. A refinement to this system has been developed by considering not only X-rays parallel to the axis of the beam but also those at 5° from the axis, corresponding to the largest angle in the fan beam. This refinement, involving the use of 2 Cu wedge shapes, greatly reduces the over-response of the peripheral detectors. This is achieved without seriously affecting the dose-reduction to the patient or the image quality. (3 refs.)

121012 Collective doses and risks from dental radiology in Great Britain. B.F.Wall, G.M.Kendall (Nat. Radiological Protection Board, Didcot, England).
Br. J. Radiol. (GB), vol.56, no.668, p.511-16 (Aug. 1983).
The continued expansion of dental radiology in Britain up to the end of 1981 is demonstrated, with a rate of increase much in excess of that seen for general medical radiography. Of the total of 7.8×10^6 dental X-ray examinations undertaken in 1981 approximately 6.7×10^6 were intra-oral, 1.5×10^5 were extra-oral and 9.1×10^5 were pantomographic. Weighted dose equivalents for typical examinations in each of these categories were calculated using specific weighting factors for the important 'remainder' organs. Values of 20 μSv, 30 μSv and 80 μSv were obtained for infra-oral, extra-oral and pantomographic techniques, respectively, corresponding to risks of fatal malignancy of 0.33, 0.5 and 1.3 per million. The estimated collective weighted dose equivalent of 212 man Sv to the population of Britain from the current level of dental radiology is predicted to result in no more than about three extra cases of fatal cancer when the age- and sex-related opportunity for manifestation of radiation-induced cancers is taken into account. (11 refs.)

121013 Dose levels outside radiotherapy beams. D.Greene, Gou-Long Chu, D.W.Thomas (Regional Dept. of Medical Phys. & Bioengng., Christie Hospital & Holt Radium Inst., Manchester, England).
Br. J. Radiol. (GB), vol.56, no.668, p.543-50 (Aug. 1983).
The specification of a radiotherapy generator calls for the leakage radiation through the housing of the source to be 0.1% (the ICRP has recently (1982) changed this figure to 0.2% of the dose rate inside the useful beam). When a patient is irradiated, the dose level outside the useful beam is not only determined by this leakage radiation, but also by scattered radiation from the beam-defining system and from the treatment volume of the patient. Measurements have been made on a 300 kV X-ray unit, and on two different 4 MV and one 8 MV linear accelerators to determine the levels of leakage radiation and scattered radiation in air, and in a phantom comparable in size to the trunk of the patient. Similar measurements have also been made for a 15 MeV neutron generator. It is shown that for all these generators the dose delivered outside the radiation beam is determined mainly by the two scattering processes mentioned, and it is argued that for linear accelerators it would be feasible to increase the permitted level of leakage radiation by a factor of 2 or 3 without a significant increase in the stray radiation delivered to the patient. (10 refs.)

121014 Used requirements on CT-based computer dose planning systems in radiation therapy: presentation of 'check lists'. H.Dahlin (Uppsala Datacentral, Uppsala, Sweden), I.-L.Lamm, T.Landberg, S.Levernes, N.Ulso.
Comput. Programs Biomed. (Netherlands), vol.16, no.3, p.131-8 (June 1983).
The expanding use of computers in radiation therapy procedures, especially the rapidly increasing use of digital CT-information, necessitates the coordination of the different systems in order to facilitate their developments. In order to define necessary demands for tomorrow a Nordic cooperation was initiated 1981 by NORDFORSK (Nordic co-operative organization for applied research), and a group of physicians and physicists having their daily work in this field of medicine and physics were invited to produce a report on 'User requirements on CT-based computed dose planning systems in radiation therapy'. The work has been done within the framework of NORDFORSK's activities and has been independent of the existing commissions and associations in the radiology field, but it has taken into consideration recommendations that have been given by or are being produced by other organizations. (11 refs.)

121015 Laser heating of thermoluminescent microdosimeters: prospects in application to imagery by ionizing radiations. J.Gasiot, J.P.Fillard (Lab. de Phys. des Solides III, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), P.Braunlich.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.168-73 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
Heating of thermoluminescent materials by pulsed or continuous laser beams is shown to be an attractive means for rapid reading of discrete or continuous two dimensional arrays; applications of this novel laser heating techniques to thermoluminescence imaging of spatial intensity of ionizing radiation with perspectives in X-ray or γ-ray imagery is considered. The thermoluminescence (TL) phenomenon is based on the presence of electron and/or hole traps which, upon exposure to ionizing radiation, become occupied with the respective charge carriers. Thermal energy is provided to replease the trapped carriers. During this process recombination takes place and photons may be emitted until the thermal equilibrium distribution of all carriers is reestablished. The number of luminous photons emitted during the heating period is usually proportional to the ionization irradiation of the material. Experiments have been done with thin layer dosimeters made by powder deposition of CaF_2, $CaSO_4$...on glass sheet. The irradiation was achieved with a Cs 137-γ-source (.66 MeV). A 10 watts CO_2 laser has enabled the layer to be heated at a small point (.5 mm diameter). The interest of such pinpoint heating is obvious; it enables a reading of the absorbed irradiation at this point in a relatively short time ($10\ \text{ms}<t<10^3\ \text{ms}$) and the future prospects in dynamics X-ray image detection to be considered. (9 refs.)

87.60P Radiation protection

(inc. radiation monitoring)

121016 Effect of plateout, air motion and dust removal on radon decay product concentration in a simulated residence. S.N.Rudnick, W.C.Hinds, E.F.Maher, M.W.First (Dept. of Environmental Health Sci., Harvard Univ. School of Public Health, Boston, MA, USA).
Health Phys. (GB), vol.45, no.2, p.463-70 (Aug. 1983).
The effectiveness of increased air motion and dust removal in reducing radon decay product concentration in residences subject to radon intrusion was evaluated in a 78-m^3 room under steady-state conditions for air infiltration rates between 0.2 and 0.9 air changes per hour. Room-size, portable electrostatic precipitators and high-efficiency fibrous filters were tested as typical residential air cleaning devices; a portable box fan and a ceiling fan were employed as typical residential air movers. Reductions in working levels of 40-90% were found. The fate of radon decay products, with and without mixing fans, was determined by direct measurement. When mixing fans were used, most of the nonairborne potential α-energy was plated out on the room surfaces; less than 10% was deposited on the fan blades or housing. Results were compared to a mathematical model based on well-mixed room air, and good agreement was obtained. (9 refs.)

121017 The effect of electric fields on ^{222}Rn daughter products in indoor air. N.Jonassen (Lab. of Appl. Phys., Tech. Univ. of Denmark, Lyngby, Denmark).
Health Phys. (GB), vol.45, no.2, p.487-91 (Aug. 1983).
A fraction of the short-lived airborne daughter products of ^{222}Rn are charged (positively) and can thus be removed from the air by means of an electric field. A theory is presented which gives the relation between the charged fraction and the total individual daughter activity at equilibrium as a function of the field applied. The theory also allows a deduction of the mobilities of the charged daughter products. Preliminary measurements were performed in a basement room with very low ventilation rate and fairly high radon concentration (5-10 pCi/l.). The electric field was established by applying a voltage to a wire mounted at a height of 1.7 m above the floor and 1 m from the walls. The radon concentration of the air as well as the concentration of the individual ^{222}Rn daughter products were measured at various wire voltages. As an approximation the field was assumed to have a cylindrical configuration. (10 refs.)

121018 Theory and practice of radon monitoring with charcoal adsorption. B.L.Cohen, E.S.Cohen (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Health Phys. (GB), vol.45, no.2, p.501-8 (Aug. 1983).
Because of interest in charcoal absorption as an inexpensive radon monitoring technique that may be suitable for mass data collection, the theory of radon adsorption from air by a charcoal bed is developed, giving numerical estimates at all stages. The method is practical down to air concentrations of about 0.1 pCi/l. A simple charcoal bed is limited by the fact that its response is highly sensitive to the time interval before termination of the exposure, but two simple methods of avoiding this problem are developed. Simple methods for determining the diffusion constant for the charcoal being used, and for optimizing the depth of the charcoal bed, are presented. (6 refs.)

121019 Measurement of time-integrated radon concentrations in residences. P.C.Nyberg, D.E.Bernhardt (US Environmental Protection Agency, Las Vegas, NV, USA).
Health Phys. (GB), vol.45, no.2, p.539-43 (Aug. 1983).
Generally it is agreed that time-integrated measurements are preferred over instantaneous measurements for the assessment of chronic health hazards. This is especially true for radon and radon progeny, since their concentrations in air are affected by many things and may easily change by a factor of 10 in a matter of hours. Furthermore, since the greatest radiation dose is delivered by the radon progeny, that average concentration is of the greatest concern. The authors have investigated several integrating monitoring techniques both in the laboratory and in the homes of several volunteers. Of particular interest are the radon progeny integrating sampling units (RPISUs), the passive environmental radon monitors (PERMs), and Track Etch detectors. All of these systems were evaluated in a variety of controlled or semi-controlled environments, and were also deployed in several residences. (6 refs.)

121020 Method for the calculation of radon response characteristics of integrating detectors. S.W.Skinner, P.C.Nyberg (US Environmental Protection Agency, Las Vegas, NV, USA).
Health Phys. (GB), vol.45, no.2, p.544-50 (Aug. 1983).
There has been substantial interest in the use of etched-track detectors for the integrated measurement of radon (^{222}Rn) and its short-lived progeny in the atmosphere of both uranium mines and residences. The methods used for the calculation of the calibration factors have been either a simple average of the factors obtained for all runs, or an average weighted by the number of replicate exposures in each run. While these methods provide a serviceable technique for estimating the radon concentration from the track density, they do not provide a test for the linearity of the data. The authors have

attempted to provide an alternative computational technique which gives a better estimate of the measurement uncertainty, demonstrates the linearity of the correlation and allows the inverse prediction of the radon concentration from a given track density. (5 refs.)

121021 The measurement of low concentrations of radon in air. R.A.Washington, W.J.Courneya (Atomic Energy Control Board, Ottawa, Ontario, Canada).
Health Phys. (GB), vol.45, no.2, p.559-61 (Aug. 1983).
The use of a longterm integrating radon monitor is discussed. The Passive Radon Integrating Monitor (PRIM) is based upon the principle of electrostatic collection of freshly-formed daughters of radon decay. A thermoluminescent dosimeter (TLD) chip is exposed to the alpha and beta particles and gamma rays that are emitted by the daughters upon decay. Its exposure, and thus the radon concentration, is obtained by measuring the thermoluminescence of the chip in a TLD reader. A control chip is used to provide a correction for background radiation levels. The advantages and disadvantages of the PRIM are discussed. The calibration procedures used are described. (12 refs.)

121022 Effects of ionizing radiation and review of the Young-Woollard document. A.M.Marko, D.K.Myers.
Report AECL-8061, Atomic Energy Canada Ltd., Chalk River, Ont. (April 1983), 11 pp.
A review of a document entitled 'The Health Dangers of Uranium Mining and Jurisdictional Questions' has been prepared. E.R. Young and R.F. Woollard submitted, in 1980, this document to the British Columbia Royal Commission of Inquiry, Health and Environmental Protection—Uranium Mining. When the authors reviewed the document it became clear that the views concerning effects of low-level radiation including alpha irradiation do not have scientific consensus. For this reason they have included a brief summary of conclusions produced by various international and national bodies on the effects of radiation on humans. (26 refs.)

121023 The distribution of average radon daughter concentrations in houses estimated from single-sample surveys. A.G.Scott (DSMA/ACRES, Toronto, Ontario, Canada).
Health Phys. (GB), vol.45, no.2, p.435-8 (Aug. 1983).
Remedial Action Programs have been established in uranium mining towns because of the high working levels (WL) in some houses. As part of the Remedial Action Program at Elliot Lake, an extensive survey of privately owned property has been carried out. The number of premises with averages above the Remedial Action Level of 20 mWL was found to be less than expected. Given the extensive use of single-sample surveys, the relationship between the distribution of single WL samples taken from a group of houses and the distribution of the annual mean WL of those houses was examined. (4 refs.)

121024 The equilibrium factor F (radon daughter concentrations in dwellings). G.A.Swedjemark (Nat. Inst. of Radiation Protection, Stockholm, Sweden).
Health Phys. (GB), vol.45, no.2, p.453-62 (Aug. 1983).
Consideration of the equilibrium factor F between the concentration of the radon daughters and the concentration of radon is a part of the evaluation of the measurements of radon daughter concentrations in dwellings when applying limits. Measurements of radon, radon daughters and air exchange rates have been carried out in 225 dwellings in Sweden. The F-factors have been compared with the theoretical model described by Wicke (1979), taking into account the wall effect. The parameters of the model are discussed. The situation of the dwelling and the habits of the occupants can be expected to have the greatest importance for the F-factors although the ventilation rate is usually the most important modifying factor. For low air exchange rates ($I<0.30\ hr^{-1}$) the probability that the F-factors were between 0.28 and 0.74 was 95% calculated according to the t-distribution. The arithmetical mean was found to be 0.51. (18 refs.)

121025 Verifying a model of radon decay product behavior indoors. R.C.Bruno (US Environment Protection Agency, Washington, DC, USA).
Health Phys. (GB), vol.45, no.2, p.471-80 (Aug. 1983).
Where it is not feasible to reduce radon levels in houses, exposure to radon decay products may still be reduced through air filtration or other air treatment techniques. A minor modification of a well-known model is used to describe the behavior and fate of radon decay products in the average indoor environment, and to examine the adequacy of the model to predict the impact of a variety of air treatment techniques on indoor radon decay product levels. It is found that the indoor environment is successfully described by the model and that plate-out of radon decay products on surfaces is much less than previous work has suggested. The model also provides a plausible explanation of the effectiveness of a variety of techniques that remove radon decay products from the air. (14 refs.)

121026 Radon daughter deposition velocities estimated from field measurements. A.G.Scott (DSMA/ACRES, Toronto, Ontario, Canada).
Health Phys. (GB), vol.45, no.2, p.481-5 (Aug. 1983).
The surface deposition rate (plateout) of unattached radon daughters was estimated from simple surface activity measurements in a number of occupied buildings, and found to be about one third of the lowest value measured in diffusion tube experiments. This low value was confirmed by surface deposition and activity measurements made in a commercial building with high radon levels, which also showed that the deposition rate was higher on walls than on floors or tables. Predictions of the ratio between airborn and surface-deposited radon daughter activity using the estimated surface deposition rate were close to the ratios observed in occupied homes. Refinements to existing models are required to explain the variability of deposition rate with surface orientation. (5 refs.)

121027 Automated system for measuring air-exchange rate and radon concentration in houses. W.W.Nazaroff, F.J.Offermann, A.W.Robb (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Health Phys. (GB), vol.45, no.2, p.525-37 (Aug. 1983).
An automated system was developed for continuously measuring the air-exchange rate and ^{222}Rn (radon) concentration in an occupied residence. The air-exchange rate is measured over 90-min intervals by tracer gas decay using sulfur hexafluoride as the tracer gas. The radon concentration is measured over 3-hr intervals using a flow-through scintillation cell. Temperatures at up to seven points are measured every half hour. A microcomputer system controls the measurements, performs preliminary data analysis, and logs the data and the results. Continuous measurement of ventilation rate and radon concentration permits the effective radon source magnitude to be calculated as a function of time. The first field application of this system was a study in Rochester, NY, of residential air-exchange rates and indoor air quality. (14 refs.)

87.65 AEROSPACE BIOPHYSICS AND MEDICAL PHYSICS (EFFECTS OF ACCELERATIONS, WEIGHTLESSNESS AND ENVIRONMENT)

(see also 94.80 Aerospace facilities and techniques; space research)

121028 Human physiology research under microgravity conditions and the proposed 'Anthrorack' facility. H.Oser (Transportation Systems, ESA, Paris, France).
ESA Bull. (France), no.35, p.40-50 (Aug. 1983).
The European Space Agency's member states have adopted a resolution to carry out a first phase of a Microgravity Research Programme covering the period 1982-5. A proposal for the contents of a second phase is under preparation and will be decided upon in about one year's time. A major element on this second phase is proposed to be the development of a multi-user facility, called 'Anthrorack', to be flown on Spacelab. It would support a wide variety of human physiological investigations on the crew members under conditions of weightlessness. (no refs.)

87.70 BIOMEDICAL ENGINEERING

121029 A computerized mass spectrometer and flowmeter system for respiratory gas measurements. I.E.Sodal, G.D.Swanson, A.J.Micco, F.Sprague, D.G.Ellis (Univ. of Colorado Health Sci. Center, Denver, CO, USA).
Ann. Biomed. Eng. (USA), vol.11, no.2, p.83-99 (1983).
Instrumentation systems for breath-to-breath analysis of respiratory gas exchange have been faulted by phase lags between various flow and composition signals and by difficulties in gathering and processing large amounts of data. The system described here represents an attempt to overcome these problems. Phase delays have been minimized by using a direct, piezoelectrically operated mass spectrometer inlet rather than an inlet capillary, by locating the mass spectrometer inlet and flow sensors in the same plane, and by incorporating design features which enhance the mass spectrometer response. Convenience in system operation and data analysis has been enhanced by integrating a computer into the system design so that the computer performs on-line data analysis and control functions and provides the primary interface between the experimenter and the instruments. Miniaturization of the instruments permits close coupling to an exercising subject. (26 refs.)

121030 Steady-state analysis and evaluation of a new thermal sensor for surface measurements of tissue perfusion. F.S.Castellana, R.Skalak, J.M.Cho, R.B.Case (Dept. of Chem. Engng. & Bioengng. Inst., Columbia Univ., New York, NY, USA).
Ann. Biomed. Eng. (USA), vol.11, no.2, p.101-15 (1983).
The steady-state response and operating characteristics of a new thermal sensor for surface measurements of local tissue perfusion have been analyzed theoretically and evaluated in vivo. The flow measurement system incorporates an electrically isolated thin-film thermal sensor, which is maintained at a fixed temperature by high frequency response electronic circuitry. The sensor rests on the tissue surface, and the power required to maintain a fixed probe to tissue temperature elevation is measured and related to tissue blood flow. A theoretical analysis of the steady-state probe response to flow changes was carried out employing the bio-heat-transfer equation and a solution based on Fourier series to describe the temperature distribution within the tissue domain. A comparison of steady-state theory to results obtained from initial experimental tests on the surface of the dog heart, over a perfusion range 0.51 to 2.00 ml/min/g, shows close agreement. The probe demonstrates good sensitivity to flow changes, provides stable and continuous measurements, and appears promising for both research and clinical applications. (14 refs.)

121031 An improved method for water vapor detection. T.Adams, M.A.Steinmetz (Dept. of Physiology, Michigan State Univ., East Lansing, MI, USA), D.B.Manner, D.M.Baldwin, S.R.Heisey.
Ann. Biomed. Eng. (USA), vol.11, no.2, p.117-29 (1983).
Describes improvements in and details for the construction, calibration and use of a device using a thermal conductivity cell for the measurement of low-level rates of water evaporation (E) from a small surface area. E is measured from 0.0 to 1.0 $mg.min^{-1}$ with a correlation coefficient of 0.999 between measured and independently verified rates and amounts of water evaporation. Data are available as a recordable analog DC voltage as well as in digital display for E and for the amount of water evaporated during an operator defined time period. The device describes is noninvasive and it is designed to be constructed of conventional components. It is useful not only for measuring transcutaneous water diffusion in normal and diseased skin but also it is adequately sensitive and rapidly responding to follow thermoregulat-

ory and psychogenic sweating in small (nom. 1.0 cm^2) skin areas. It can also be used to measure accurately and precisely the rates at which water is adsorbed by and removed from inanimate materials, as well as to determine how much water they store. (19 refs.)

121032 Which parameters of circulation can be made visible by electronic oscillography? III. M.Prag (Univ. Erlangen, Nurnberg, Germany).
Acta Medicotech. (Germany), vol.30, no.6, p.216-18 (Dec. 1982). In German.
For pt.II see ibid., vol.30, no.4, p.142, 1982. Blood pressure measurements on the lower arm constantly show a difference between peak measurements taken with rising pressure and those with falling pressure. This could be due to a systematic error, and which type of measurement is the more accurate cannot be determined. To avoid error due to a stagnation effect in the veins and capillaries cut off by the first measurement, adequate recovery time should be allowed between the two measurements. While it is desirable that the sleeves should always be pulled really tight, it is found that the tighter the fit, the larger are the amplitudes recorded. There are two possible explanations. The first, due to Sturm, is that a rounded sleeve compresses a smaller section of artery than one which lies flat, so that the volume change is smaller. The second is that an equally large volume variation is set against a greater basic volume in the sleeve, so that it is smaller in proportion and hence smaller amplitudes are plotted. (no refs.) *D.J.B.*

121033 Accuracy of computer measurements of QRS duration using spatial magnitude—agreement with human readers. G.E.Dower (Polarcardiography Lab., Shaughnessy Hospital, Vancouver, British Columbia, Canada), D.Berghofer, M.Kiely.
Comput. & Biomed. Res. (USA), vol.16, no.5, p.433-45 (Oct. 1983).
The beginning and end of the QRS complex in the ECG are often poorly defined, leading to poor agreement between measurements of QRS duration made by computer and human readers. In the spatial magnitude tracing, on the other hand, definition of QRS onset and offset points is less ambiguous. In 50 normal subjects, 345 QRS durations were measured by computer and visually. The correlation coefficient between the two methods was 0.93; the typical discrepancy was less than 3 msec. For a series of 100 inpatients, similar results were obtained even though one of the human readers was unfamiliar with the spatial magnitude display. Although the spatial magnitude is obtained from vectorcardiographic xyz signals, it could be derived from three simultaneous ECG leads, and applied to computer programs analyzing the 12-lead ECG. (16 refs.)

121034 Detection of muscle tremors and baseline sway in an ECG. R.E.Bonner (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.1109-10 (Aug. 1983).
A method is described for processing an electrocardiagram (ECG) waveform to detect the presence of 'noise' caused by muscle tremors or baseline sway. (no refs.)

121035 Medical applications of silicon sensors. J.M.L.Engels, M.H.Kuypers (Honeywell & Philips Medical Electronics BV, Best, Netherlands).
J. Phys. E (GB), vol.16, no.10, p.987-94 (Oct. 1983).
For invasive medical sensors, silicon sensors have a number of specific advantages: miniaturisation, low cost, high flexibility, high reliability, choice of parameter, packaging and integration of electronics. Specific packaging problems for microtransducer catheters (MTCS) whereby the transducer is a silicon sensor are related to the construction of the transducer housing and choice of materials. The main object is to maintain the sensitivity of the silicon sensor for the specific parameter while designing a proper housing. This is illustrated by describing solutions for pressure- and oxygen-sensitive MTCSs. Two sets of factors which promote the use of MTCS in hospitals are discussed. The first is the quality of signal and the possibility of continuous monitoring of the measured parameter. The second comprises patient comfort, simpler application techniques and economic factors. (41 refs.)

121036 Noninvasive measurement of pleural pressure by surface inductive plethysmography. M.J.Tobin, G.A.Jenouri, H.Watson, M.A.Sackner (Dept. of Medicine, Mount Sinai Medical Center, Miami Beach, FL, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.267-75 (July 1983).
Recession of the suprasternal fossa that takes place during inspiration can be monitored with surface inductive plethysmography (SIP). The transducer consists of a flat loop of Teflon-insulated wire coupled to the skin. Static lung compliance during inflation was obtained using a 'null procedure' (described) in six normal subjects and eight patients with lung disease, and both SIP and esophageal pressure gave similar values. Dynamic lung compliance was calculated at respiratory rates from 20 to 60 breaths/min; simultaneous SIP and esophageal balloon values in seven normal subjects and seven patients with lung disease showed close correlation. Frequency dependence of compliance was demonstrated in a group of smokers with small airway disease whereas compliance was not frequency dependent in normals. Surface inductive plethysmography appears to be a reliable noninvasive alternative to intraesophageal pressure recordings to obtain static and dynamic lung compliance. (20 refs.)

121037 Noninvasive ventilatory monitoring with bellows pneumographs in supine subjects. D.R.Morel, A.Forster, P.M.Suter (Dept. of Anesthesia, Univ. of Geneva, Geneva, Switzerland).
J. Appl. Physiol. (USA), vol.55, no.2, p.598-606 (Aug. 1983).
The authors compared simultaneous measurements of ventilatory movements obtained by a bellows pneumograph (BP) and a respiratory inductive plethysmograph (RIP) vs. integrated volume from a pneumotachograph in seven healthy volunteers during different respiratory patterns. The purpose of this study was to assess if a computer-aided calibration procedure could improve the accuracy of BP, a simple semiquantitative method for noninvasive ventilatory monitoring in supine subjects. Both devices were repeatedly calibrated against a pneumotachograph in the same posture with a computer-aided least-squares method. One calibration maneuver was sufficient to achieve a minimal relative difference in volume measurements between the RIP as well as the BP and the pneumotachograph of less than 1.2 ± 4.5 (SD) %. The accuracy remained in this range during the subsequent calibrations with time (1 h) and after body movements. However, this difference increased significantly with both devices when the subjects were studied in the lateral decubitus position. The present study indicates that despite theoretical advantages of the RIP, the BP, when properly calibrated, has similar performances in supine subjects for monitoring ventilation; it is simpler and less expensive than the RIP and is devoid of electrical drift and artifacts. (15 refs.)

121038 Ergometric evaluation of pathological gait. G.A.Cavagna, L.Tesio, T.Fuchimoto, N.C.Heglund (Istituto di Fisiologia Umana, Univ. di Milano, Milan, Italy).
J. Appl. Physiol. (USA), vol.55, no.2, p.607-13 (Aug. 1983).
At each step of walking, the center of gravity of the body moves up and down and accelerates and decelerates forward with a combined movement that allows an appreciable transfer (R) between gravitational potential emergy, and kinetic energy, as occurs in a pendulum. The positive work and power to lift the center of gravity, to accelerate it forward, and to maintain its motion in a sagittal plane, the amount of R, the maximal height reached during each step by the center of gravity, and the step length and frequency may all be determined by a microcomputer a few minutes after a subject walks on a force platform. This method was applied to the analysis of pathological gait in the attempt to measure quantitatively the alteration of the normal locomotory movement of the center of gravity. The strides of the patient were compared with the strides of normal subjects; in addition, the movement of the center of gravity of the patient during the stance on the affected limb was compared with the movement of the center of gravity during the stance on the unaffected limb, thus giving an index of the asymmetry of locomotion. (7 refs.)

121039 Subtraction of electrocardiographic signal from respiratory electromyogram. R.Bloch (McMaster Medical School, Chedoke Rehabilitation Hospital, Hamilton, Ontario, Canada).
J. Appl. Physiol. (USA), vol.55, no.2, p.619-23 (Aug. 1983).
A method is presented to selectively suppress interfering electrocardiographic artifacts from the surface-recorded respiratory muscle electromyographic (EMG) signal. This method has application in the frequency analysis of respiratory muscle EMG. (7 refs.)

121040 Using body surface movements to study breathing. H.R.Gribbin (Dept. of Medicine, Univ. Coll. Hospital, London, England).
J. Med. Eng. & Technol. (GB), vol.7, no.5, p.217-23 (Sept.-Oct. 1983).
The chest wall comprising both rib cage and abdomen moves during breathing, and when suitably calibrated this motion can be used to monitor pulmonary ventilation without the need for face-masks or mouthpieces. Such noninvasive methods of studying breathing are likely to become more widely used in the future, especially in the investigation of respiratory control and sleep-disordered breathing. This review describes the physiological basis of these measurements and examines the practical and theoretical limitations of calibration techniques based on the two degrees-of-freedom model of chest-wall motion. (14 refs.)

121041 An optimal linear filter for the reduction of noise superimposed to the EEG signal. F.Bartoli, S.Cerutti (Dipartimento di Elettronica, Politecnico di Milano, Milan, Italy).
J. Biomed. Eng. (GB), vol.5, no.4, p.274-80 (Oct. 1983).
A procedure for the reduction of super-imposed noise on EEG tracings is described, which makes use of linear digital filtering and identification methods. In particular, an optimal filter (a Kalman filter) has been developed which is intended to capture the disturbances of the electromyographic noise on the basis of an a priori modelling which considers a series of impulses with a temporal occurrence according to a Poisson distribution as a noise generating mechanism. The experimental results presented refer to the EEG tracings recorded from 20 patients in normal resting conditions: the procedure consists of a pre-processing phase (which uses also a low-pass FIR digital filter), followed by the implementation of the identification and the Kalman filter. The performance of the filters is satisfactory also from the clinical standpoint, obtaining a marked reduction of noise without distorting the useful information contained in the signal. (26 refs.)

121042 A gait analysis system in clinical practice. G.Gifford, J.Hughes (Northwick Park Hospital, Harrow, England).
J. Biomed. Eng. (GB), vol.5, no.4, p.297-301 (Oct. 1983).
A gait analysis system using a transduced walkway, monitored by microcomputer to measure the time and distance factors of gait, has been in regular clinical use for over two and a half years. The results are easy to understand and have provided objective data which has been found useful in a number of clinical situations. Some of the ways in which the system has been used are described. (2 refs.)

121043 Recent topics in medical measurements. F.Kajiya, Y.Ogasawara, K.Mito, S.Tadaoka, M.Nakai, O.Hiramatsu, G.Tomonaga, N.Hohki.
Syst. & Control (Japan), vol.27, no.3, p.169-77 (March 1983). In Japanese.
Bioinstrumentation in the direct measurement of biological properties can be divided into two large categories: (1) the measurement of energies produced in living organisms themselves, e.g. pressure changes, volume changes, vibratory action, potentials and heat; and (2) the observation of response to applied energy such as X-rays, ultrasonic waves, magnetic fields, radioisotopes, heat, or laser beams. The fundamental biological parameters in the bioinstrumentation of the circulatory system are heart features, blood flow and blood pressure. A brief outline is given of ultrasonic-echo imaging, X-ray imaging, positron CT imaging and NMR imaging techniques in heart dimensions instrumentation, of heart catheterization for blood pressure instrumentation and of the ultrasonic pulse doppler method and the laser doppler method for blood flow instrumentation. (15 refs.) *K.B.*

121044 A programmable limb testing system (and some measurements of intrinsic muscular and reflex-mediated stiffnesses). C.Billian, G.I.Zahalak (Dept. of Mech. Engng., Washington Univ., St. Louis, MO, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.6-11 (Feb. 1983). [received: Oct. 1983]
A new versatile apparatus for investigating the neuromusculoskeletal dynamics of the upper limb, termed the Programmable Limb Testing System (PLTS) has been designed, built, and tested. The planning, construction, and operation of this system are described in this paper. Results are presented from a limited set of experiments, measuring intrinsic muscular and reflex-mediated stiffnesses of the triceps brachii, which exhibit the system's performance and some of its capabilities. (16 refs.)

121045 Error analysis of a system for measuring three-dimensional joint motion. W.J.Suntay, E.S.Grood, M.S.Hefzy, D.L.Butler, F.R.Noyes (Dept. of Orthopaedic Surgery, Univ. of Cincinnati, OH, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.127-35 (May 1983). [received: Oct. 1983]
In the past ten years there has been increased use of six-degree-of-freedom instrumented spatial linkages for the measurement of biological joint motions. In spite of the increased popularity, little information has been reported on the accuracy of these devices. In this paper, the authors present a two-part investigation of the accuracy of the instrumented spatial linkage when used to measure knee joint kinematics. In the first part, they present the results of a theoretical analysis and an experimental determination of the errors associated with spatial linkage systems. In the second part, they describe the errors associated with a bi-planar X-ray system used to obtain the coordinate transformation between the linkage ends and coordinate systems located in the bones comprising the joint. The authors found that the theoretical error analysis consistently overestimated the actual measurement error, thus providing an unreliable estimate of errors. The experimental study of both the linkage system and the bi-planar X-ray system demonstrated that the accuracy of displacement measurement is insensitive to large systematic errors in position measurement. (31 refs.)

121046 A preliminary use of ferrography in the study of arthritic diseases. G.H.Mills (Dept. of Metall., Brunel Univ., Uxbridge, England), J.A.Hunter.
Wear (Switzerland), vol.90, no.1, p.107-11 (15 Sept. 1983). (First International Conference on Advances in Ferrography, Swansea, Wales, 22-24 Sept. 1982).
Ferrography applied as a failure analysis or condition monitoring technique to engineering components has proved successful over the past decade. As human joints are similar to some lubricated engineering components it is natural to consider the application of ferrography to the examination of 'wear particles' in synovial fluid obtained from human joints. An attempt to compare the number and type of wear particles with the extent of damage to articular surfaces has been undertaken with some limited success. (5 refs.)

121047 A user's look at technology for hospitals. D.Harrington (New England Medical Center, Boston, MA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.15-3/1-5
Looks at the technology presently in hospitals, discussing some common problems and offering suggestions for future designs, especially for use by nurses. (no refs.)

121048 Rational gain compensation for attenuation in cardiac ultrasonography. H.E.Melton,Jr. (Depts. of Electrical & Computer Engng. & Internal Medicine, Univ. of Iowa, Iowa City, IA, USA), D.J.Skorton.
Ultrason. Imaging (USA), vol.5, no.3, p.214-28 (July 1983).
A new method of compensating for the attenuation of ultrasound by chest wall, myocardium and blood has been devised by using an optimum threshold to distinguish between blood and myocardium. This allows changing receiver gain at rates suitable for either blood or myocardium for each line-of-sight forming a real-time image. Compensation artifacts arising from the effects of speckle or phase cancellation are minimized by using a one-bit digital filter after threshold detection. This method of compensation is a necessary first step toward quantitative two-dimensional echocardiography. (12 refs.)

121049 Development of a cryoprobe suitable for gynaecological applications. N.Girishchandra Shah (Dept. of Obstetrics & Gynaecology, Sheth KM School of Post Graduate Medicine & Res., Ahmedabad, India), V.M.Mehta, G.Harilal Shah.
Indian J. Cryog., vol.8, no.2, p.116-20 (1983).
Cryosurgery, meaning clinically controlled application of destructive effects of freezing, is painless, achieves haemostasis and destroys the tissue with a sharp line of demarcation. It can be used as an O.PD. procedure because of its simplicity and painlessness. Cryosurgery has never gained momentum in India because of the price of the instrument required. A project to develop a cheap and dependable cryo-probe was undertaken so that the cryo-probe becomes a useful tool in the day-to-day practice of each and every gynaecologist. The Joule-Thomson effect was utilized to design a cheap and dependable cryo-probe working on commonly available liquid gases like carbon dioxide, freon and nitrous oxide. (no refs.)

121050 Heart pacemakers: Australian success story. P.Watson.
Electron. Aust. (Australia), vol.45, no.6, p.32-9 (June 1983).
Discusses the development of pacemakers in Australia. Describes the modern programmable pacemaker in which a whole range of operating parameters can be changed, and set up in any combination, by means of an external program unit. The pulses are magnetic, generated by a large and powerful electromagnet in an external programmer. They are sensed in the pacemaker by means of a tiny reed switch, the glass of which is a mere 6 mm long and about 1 mm diameter. As well as the electromagnet, the programmer contains all encoding circuitry, switches, indicators, etc. In use, it is simply placed over the implantation site. (no refs.)

121051 Speech signal presentation to the totally deaf. J.R.Walliker (Dept. of Phonetics & Linguistics, Univ. Coll. London, London, England), S.Rosen, E.E.Douek, A.J.Fourcin, B.C.J.Moore.
J. Biomed. Eng. (GB), vol.5, no.4, p.316-20 (Oct. 1983).
Describes a system for single-channel electrical stimulation of the totally deaf. The patient wears a removable electrode assembly which stimulates the cochlear promontory and can be inserted and removed like the earmould of a hearing aid. This approach minimises therisk of mechanical or electrochemical damage to structures within the cochlea. Charge-balanced stimulation is used to present those speech pattern elements that are matched to the patients' lipreading needs and their new sensory abilities. Objective tests show improvements both in patients' perceptive and productive abilities. (13 refs.)

121052 Microprocessor-controlled driving unit for artificial hearts. N.Nessler (Inst. for Experimental Phys., Innsbruck Univ., Innsbruck, Austria).
Microprocess. & Microsyst. (GB), vol.7, no.7, p.306-13 (Sept. 1983).
Heart failure and cardiac infarction are the main causes of death today. The author describes a driving unit for artificial hearts which uses an electromagnet as a power source and has hydraulic transmission to the artificial ventricle. (8 refs.)

121053 Stresses in a Harrington distraction rod: their origin and relationship to fatigue fractures in vivo. J.B.Brunski, D.C.Hill (Dept. of Biomedical Engng., Rensselaer Polytech. Inst., Troy, NY, USA), A.Moskowitz.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.101-7 (May 1983). [received: Oct. 1983]
As illustrated by the case study described in this paper, in-vivo fractures of distraction rods often occur by metallurgic fatigue at the junction between the smooth and ratcheted parts of the rod (i.e. at the first ratchet junction, FRJ). To clarify causative factors of fatigue at the FRJ, stresses are analyzed in a standard 11-in. rod using both experimental and theoretical methods. The analyses reveal how distraction force, eccentricity of loading, rod geometry and material determine the stresses at the FRJ. These stresses can exceed the fatigue endurance limit for certain clinically encountered conditions. (27 refs.)

121054 Monitoring fracture site properties with external fixation. G.S.Beaupre, W.C.Hayes, M.H.Jofe, A.A.White,III (Charles A. Dana Res. Inst., Beth Israel Hospital, Boston, MA, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.2, p.120-6 (May 1983). [received: Oct. 1983]
An in-vitro system has been devised to monitor the properties of an idealized fracture site immobilized with a Hoffman-Vidal external fixator. A dial gage was used to measure the relative pin displacements under controlled axial loading. The displacement measurements were then used in conjunction with a finite element model to predict the modulus of an idealized fracture site. Five fracture sites made of neoprene disks of different mechanical properties were monitored in order to simulate the increasing modulus of a healing fracture. Good agreement was observed between directly measured mechanical properties of the neoprene and those inferred from the combined finite element and pin displacement tests. (18 refs.)

121055 The difference between a communication aid and a speech prosthesis. B.R.Baker (BCS Corp., Cumberland, MD, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.756-61 vol.2
Many devices developed in the past decade are aiding severly disabled people to communicate. Yet this new technology often remains beyond the physical or intellectual capabilities of the majority of possible users. A new generation of communication systems is needed. A clarification of terminology can be instrumental in facilitating the development and distribution of these new systems. (no refs.)

121056 Design of a pulse duplicator system for prosthetic heart valves. M.Umezu, K.Kawazoe, N.Fujii, T.Fujita, T.Akutsu (Nat. Cardiovascular Center Res. Inst., Osaka, Japan).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.751-8
In order to obtain a useful information when selecting a prosthetic heart valve in each patient with valvular disease, the authors have developed an in-vitro test apparatus for the evaluation of the characteristics of various valves. It consists of a pneumatically driven pulsatile pump, natural rubber tubes, compliance regulating tanks and needle valves. The system was designed so that the flow dynamics would show close resemblance to human haemodynamics in the normal state as well as in the heart failure. Commercially available valves (seven mechanical valves and six biological valves) were tested. In the inlet (mitral) position, the inflow resistance across porcine valves and a ball valve were higher than those across disc valves and bovine pericardial valves. In the outlet (aortic) position, pump output and pressure gradient across the valves were similar in all valves except for the ball valve. On the basis of the simulation data, the bovine pericardial valve and one of the tilting disc valves were found to be the most suitable valves for clinical use. (2 refs.)

121057 Development of an electromyogram (EMG) controlled above-knee prosthesis using microcomputer. J.Cheng (Dept. of Electrical Engng. & Computer Sci., Shanghai Jiao Tong Univ., Shanghai, China), K.Koganezawa, I.Kato.
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.865-72
Deals with the schemes which solved the two problems of an above-knee prosthesis during the swing phase. The first problem is to adjust continuously the damping performance of the knee-joint according to the walking period of the next step predicted from the myoelectric signal. The second problem is to generate the driving torque to eliminate the swing delay of the prosthetic shank. The authors have developed a new type of WLP-5 above-knee prosthesis with the above-mentioned functions and its portable control unit with the microcomputer. The clinical walking experiment of an above-knee amputee has been performed using the WLP-5 system. From the results, the effectiveness of the WLP-5 system has been ascertained. (3 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

121058 Determination of the thickness of inhomogeneous membrane by the optical method. V.I.Pasechnik (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.5, p.960-2 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.914-15 (1982). [received: Sept. 1983]
A method has been devised for determining the thickness of a bilayer which allows for the inhomogeneity of the membrane. The method is based on the reflective capacity of the membrane. (7 refs.)

121059 A computer system for real-time data acquisition and analysis of biopotentials and quantal content at the neuromuscular junction. H.H.Liu, Y.I.Kim (Dept. of Biomedical Engng. & Neurology, Univ. of Virginia School of Medicine, Charlottesville, VA, USA).
Comput. Programs Biomed. (Netherlands), vol.16, no.3, p.161-74 (June 1983).
A computerized data acquisition system for online analysis of the parameters of neuromuscular transmission is described. Both hardware usage and software methodologies are discussed with regard to sampling in real-time and analyzing miniature end-plate potentials (MEPPs), end-plate potentials (EPPs) and quantal content of the evoked transmitter release. Significant features of the program include: (1) automatic threshold determination for MEPP detection; (2) the use of a circular buffer to give pre-trigger information; (3) real-time noise spike rejection; (4) an automatic procedure for EPP failure detection; (5) rapid quantal content determinations by several methods as well as complete MEPP and EPP waveform analysis. The system has proven both accurate and reliable during more than two years of use. Advantages of the system over conventional methods include: (1) increased accuracy and efficiency in data analysis; (2) immediate availability of results; (3) convenient data storage; (4) flexibility to meet changing requirements. (21 refs.)

121060 Automated analysis of neuromuscular 'jitter'. L.Antoni, E.Stalberg (Dept. of Clinical Neurophysiology & Medical Engng., Univ. Hospital, Uppsala, Sweden), D.Sanders.
Comput. Programs Biomed. (Netherlands), vol.16, no.3, p.175-88 (June 1983).
This article describes an interactive program for real time analysis of the neuromuscular jitter. Two implementations, using different hardware for data acquisition, reflect the modular design and flexibility of the software. Details on the time windows are given as well as the available commands. The program features: (1) immediate feedback of acquired data; (2) optional manual editing of data; (3) simple yet flexible commands; (4) several plot options of raw or analysed data; (5) database interface. (13 refs.)

121061 A new method for automatic metaphase finding adaptable to different chromosome preparations. D.Schoevaert-Brossault, C.Leonard, J.Selva (Lab. d'Histologie-Embryologie-Cytogenetique, Hopital de Bicetre, Kremlin Bicetre, France).
Comput. Programs Biomed. (Netherlands), vol.16, no.3, p.195-202 (June 1983).
A FORTRAN computer program, running on a Digital PDP 11-34 minicomputer, has been developed for use in conjunction with a Cambridge Quantimet 720 image analyzer for the investigation of metaphase preparations in routine cytogenetics. During a short initiation phase the program is adapted to the type of metaphase being analyzed. The program is fast and its performance is good, even at low microscopic magnifications. It has other uses in biology for all investigations and characterizations of groups of small distinct elements widely spread within a preparation (e.g. autoradiography, bacteriology). (9 refs.)

121062 High-speed cineradiographic system for biomechanics impact research. M.Bender, N.Alem, G.Nusholtz, J.W.Melvin (Highway Safety Res. Inst., Univ. of Michigan, Ann Arbor, MI, USA), W.L.Rogers.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.130-5 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
A high-speed 16-mm cineradiographic system previously developed for use in biosciences research has been upgraded in capability by (1) increasing the X-ray field to 35-cm (14-in) by 43-cm (17-in), (2) incorporating a 35-mm high-speed motion picture to increase resolution, and (3) acquisition of a second X-ray head for three-dimensional X-ray stereophotogrammetric studies. This system now consists of a 35-mm Photosonics 4B camera, capable of 2500 frames per second, which views a 50-mm (2-in) diameter output phosphor of a highgain, 4-stage, magnetically focused image intensifier tube, gated on and off synchronously with the motion picture camera. A lens optically couples the input photocathode of the image tube to X-ray fluorescent (rare earth) screen images produced by a smoothed DC X-ray generator of a conventional type. The system is capable of a wide range of magnification ratios. (5 refs.)

121063 Recent advances in laser fluorescence microscopy. F.Docchio, A.Longoni, R.Ramponi, C.A.Sacchi (Centro di Studio per l'Elettronica Quantistica e la Strumentazione Elettronica, Istituto di Fisica del Politecnico, Milano, Italy), G.Bottiroli, I.Freitas.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.16-21 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
First, the authors present the latest version of a laser microfluorometer, characterized by high spatial and temporal resolution, and by a high degree of versatility and automation due to microprocessor control. The authors also present the latest results in the application of this technique to the study of the interaction properties of the photosensitizing antitumor drug Hematoporphyrin Derivative (HpD) at cellular level. (16 refs.)

121064 Inexpensive laser Doppler instrument for cell electrophoresis. D.G.Spendley, D.P.Jones, A.T.Smith, D.S.L.Lloyd, E.D.Cooke (Dept. of Medical Electronics, St. Bartholomew's Hospital, London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.174-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A laser Doppler electrophoresis system for the measurement of cell mobilities in hospital laboratories has been developed. Standard inexpensive optical components are used together with a 2 mW HeNe laser and a photodiode detector. An equal path length fringe mode system is used. No elaborate antivibration precautions have been found necessary. The electrophoretic measurement cell is robust and simple. Data are collected and analyzed by an existing Nova 3D minicomputer utilizing standard software used routinely for electrophysiological signal processing. Mobility spectra are presented from various human and animal blood cells and from a tissue culture cell line. (5 refs.)

121065 Measurement of displacements introduced by extra-oral orthodontic forces on a macerated skull by means of speckle interferometry: a preliminary report. J.Kleutghen, L.R.Dermaut, P.M.Boone, M.De Caluwe (Dept. of Orthodontics, State Univ. Gent, Gent, Belgium).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.538-50 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A technique was developed for measuring tooth displacements, caused by extraoral orthodontic forces. By using speckle-interferometry as the measurement technique and a macerated dry human skull as test object, a reliable investigation procedure is developed. Resolution of total displacement into vector components is realized by simple trigonometry. These observations showed to be very interesting for the biomechanics of clinical headgear Forces. for the purpose of orthodontic research, speckle interferometry was applied and is expected to be a promising technique. (13 refs.)

121066 A constant-velocity cycle ergometer for the study of dynamic muscle function. N.McCartney, G.J.F.Heigenhauser, A.J.Sargeant, N.L.Jones (Dept. of Medicine, McMaster Univ. Health Sci. Centre, Hamilton, Ontario, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.212-17 (July 1983).
A cycle ergometer has been designed to measure the force exerted on the pedal cranks during maximum effort at a variety of constant velocities. Preset crank velocities of 13-166 rpm are established by a controlled 3-hp motor and cannot be overcome by the subject. Torque is measured by strain gauges bonded to the crank shafts; peak torque, peak power, work, and average power are derived for each pedal cycle. Studies in 30 healthy male subjects established reproducibility and normal standards. During exercise for 45 s at a constant velocity of 60 rpm, there was a wide intersubject variation in both maximal torque (118-226 N.m) and the percentage decline in torque (27.2-52.0%). The decline in torque was inversely related to maximal O_2 intake ($r=0.84$). During short (10-s) periods of exercise at six cranks velocities between 60-160 rpm, a linear inverse relationship between maximal peak torque and pedal crank velocity was observed. The peak torque-velocity relationship and the percentage decline in peak torque during 30 s exercise at 60,

100, and 140 rpm were reproducible within a given subject, the coefficient of variation was less than 10%. (13 refs.)

121067 Two-sidearm tracheal cannula for respiratory airflow measurements in small animals. J.P.Mortola, A.Noworaj (Dept. of Physiology, McGill Univ., Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.55, no.1, p.250-3 (July 1983).
Measurements of mean flow and tidal volume using four 2-sidearm tracheal cannulas (0.7, 1.5, 1.8, and 2.5 mm ID) are described. They have a linear response up to flows of 6, 10, 12, and 28 ml.s^{-1}, respectively, that correspond to 100 ml.s^{-1}.kg^{-1} or more, depending on the body size of the animals (15-350 g) in which they could be used. These characteristics, coupled with small volume and flow resistance, make the use of these cannulas as pneumotachographs a suitable and very practical way of measuring mean airflow and tidal volume in anesthetized small animals, ranging in size from newborn rats to newborn puppies. (6 refs.)

121068 A respiratory function jacket for measuring tidal volume and changes in FRC. D.W.Cartwright, G.A.Gregory, M.M.Willis (Dept. of Anesthesia & Pediatrics, Univ. of California, San Francisco, CA, USA).
J. Appl. Physiol. (USA), vol.55, no.1, p.263-6 (July 1983).
Describes a simple application of a mercury-in-rubber strain gauge in a jacket used to measure tidal volume in paralyzed, mechanically ventilated rabbits. The jacket produces a record with a straight base line. Shifts of this base line can be used to assess changes in functional residual capacity (FRC). (6 refs.)

121069 A programmable electrically braked ergometer. D.Giezendanner, P.E.di Prampero, P.Cerretelli (Dept. of Physiology, Univ. of Geneva, Geneva, Switzerland).
J. Appl. Physiol. (USA), vol.55, no.2, p.578-82 (Aug. 1983).
Research protocols require that the actual braking power (W_b) of electrically braked ergometers (EBE) is precisely set at the chosen power level, stable, and universally programmable. No commercially available EBEs appear to meet jointly the above conditions. In fact, EBE settings were found to deviate up to 25% from the reference level (W_R), their W_b to drop as a result of increased temperature as much as 30% within 1 h of continuous operation, and the programming features to be limited and rigid. To overcome the above pitfalls a procedure for building or improving EBEs is presented whereby (1) the stator of the brake used as a dynamometer is mounted on ball bearings, the torque being transmitted to a strain gauge; (2) the number of revolutions of the rotor is measured on a cogwheel by a proximity detector and an impulse counter; and (3) the torque and impulse number signals are fed into a low-priced microcomputer controlling the brake's power supply. The device has proved to be satisfactory in following any preprogrammed exercise-forcing functions. In the range ~10-500 W, $W_b = W_R \pm 1\%$. (11 refs.)

121070 A Hall effect transducer for measuring length changes in mammalian diaphragm. C.V.Peterson,Jr., A.B.Otis (Dept. of Physiology, Univ. of Florida, Gainesville, FL, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.635-41 (Aug. 1983).
Describes a length transducer useful for measuring length changes in the diaphragm of a dog which may be made by connecting a commercially available Hall generator to a Plexiglas plate ($5 \times 10 \times 3$ mm, 0.5 g), and suturing the plate to the surface of the muscle. A permanent magnet ($20 \times 10 \times 4$ mm, 1.5 g) is attached to the diaphragm at a distance of 2 or 3 cm along the expected direction of length change. Fine wires from the terminals of the Hall generator are connected to an external constant-current source and to solid-state circuitry which provides amplification, linearization, and temperature compensation of the output signal. Model experiments indicate that the length measurements may be accurate within 5% if the distance between the magnet and Hall generator is greater than 5 mm. With this type of transducer measurements of segmental length changes in the diaphragm of an anesthetized dog have been successfully recorded. (35 refs.)

121071 A computerized system for densitometric analysis of the microcirculation. B.R.Duling, D.N.Damon, S.R.Donaldson, R.N.Pittman (Univ. of Virginia School of Medicine, Charlottesville, VA, USA).
J. Appl. Physiol. (USA), vol.55, no.2, p.642-51 (Aug. 1983).
An analytical system for measuring size, motion, and light absorption of objects in the field of a microscope is described. The design criteria have been chosen to produce a system that permits acquisition of densitometric information at a number of points within the field and permits computation of important variables from the densitometric data. Relatively simple fiber-optics systems for sampling light intensity at selected locations in the microscope field are described. Computer programs are outlined that permit computation of microvessel diameter, red cell velocity, and hemoglobin oxygen saturation. The sampling systems and programs are quite general in nature and should be applicable to other types of related measurements and computing devices. (7 refs.)

121072 A close-range photogrammetric system for 3-D measurements and perspective diagramming in biomechanics. S.K.Ghosh (Dept. of Photogrammetry, Laval Univ., Quebec, Canada).
J. Biomech. (GB), vol.16, no.8, p.667-74 (1983).
Criteria considered in developing a close-range photogrammetric three-dimensional mapping system and its overall performance are discussed. The system consists of a stereophotographic capability of two cameras with synchronized shutters, a stereoplotting instrument with three-dimensional digitizing capability and a Calcomp plotter. Mapping of human knee-bones (femur and tibia) and perspective diagramming for various attitudes of one bone head with regard to the other are illustrated. The system works off-line with respect to the three principal components. The system is fully operational and is considered very efficient with regard to the current needs. (4 refs.)

121073 Unbiased linear property estimation for spheres, from sections exhibiting overprojection and truncation. K.R.Clarke, M.N.Moore (Inst. for Marine Environmental Res., Plymouth, England).
J. Microsc. (GB), vol.131, pt.3, p.311-22 (Sept. 1983).
In the biological sciences, stereological techniques are frequently used to infer changes in structural parameters (volume fraction, for example) between samples from different populations or subject to differing treatment regimes. Nonhomogeneity of these parameters is virtually guaranteed, both between experimental animals and within the organ under consideration. Techniques are therefore required for unbiased estimation of parameters from potentially small numbers of sample profiles. Unbiased estimates of linear properties are derived in one special case—the sampling of spherical particles by transmission microscopy, when the section thickness is not negligible and the resulting circular profiles are subject to lower truncation. The derivation uses the general integral equation formulation of Nicholson (1970); the resulting formulae are simplified, algebraically, and their efficient computation discussed. Bias arising from variability in slice thickness is shown to be neglible in typical cases. The strategy is illustrated for data examining the effects, on the secondary lysosomes in the digestive cells, of exposure of the common mussel to hydrocarbons. Prolonged exposure, at 30 μg l^{-1} total oil-derived hydrocarbons, is seen to increase the average volume of a lysosome, and the volume fraction that lysosomes occupy, but to reduce their number. (18 refs.)

121074 Stereoogy of tubular structures. A.Baddeley, P.Averback (Statistical Lab., Univ. of Cambridge, Cambridge, England).
J. Microsc. (GB), vol.131, pt.3, p.323-40 (Sept. 1983).
The morphology of a tubular structure can be characterized, in at least some of its important respects, through stereological methods. The authors study the geometric meaning of standard stereological quantities when applied to turbular structures, with particular regard to their curvature or tortuosity. Measures defined specifically in relation to tubular structures are also introduced for practical use. The ideal smooth bent cylinder, used, is not realistic but provides general principles from which a more specialized investigation should be developed. The emphasis is placed on simple counting methods of measurement, specifically the tangent counts introduced by DeHoff, and counts of section profiles exhibiting a particular character (such as 'figure-eights'). These measures convey information about the tortuosity of tubular structures, whereas the standard indices V_V, S_V, M_V give no information about tortuosity. Some data from human testicular tubules are discussed. (19 refs.)

121075 The complex-shaped 'perforated' synapse, a problem in quantitative stereology of the brain. D.M.G.De Groot, E.P.B.Bierman (Medical Biological Lab., Rijswijk, Netherlands).
J. Microsc. (GB), vol.131, pt.3, p.355-60 (Sept. 1983).
Failure to appreciate the consequences for stereological work of the simultaneous presence of complex-shaped perforated and disc-like non-perforated synapses in brain tissue results in underestimation of synaptic profile length and overestimation of synaptic density when measured in randomly selected ultrathin E-PTA slices. This problem can be solved by using serial slices and a calculation method which makes no assumptions about synaptic size and shape. A three-dimensional reconstruction is unnecessary. (19 refs.)

121076 Vascular smooth muscle orientation in straight portions of human cerebral arteries. J.G.Walmsley (Dept. of Biophys., Univ. of Western Ontario, London, Ontario, Canada).
J. Microsc. (GB), vol.131, pt.3, p.361-75 (Sept. 1983).
A technique of embedding, sectioning and analysis has been developed for studying the orientation and proportional composition of smooth muscle in the straight portions of human major cerebral arteries. Various distortions, which occurred during processing and sectioning, were measured quantitatively. Nerve fibres were implanted as a reference frame within the paraffin block containing an arterial bifurcation. The nuclei of smooth muscle have been treated as three-dimensional vectors of cellular orientation. The projected length in the plane of the section and the section thickness were used to define section pitch. The averaged pitch for the five sections from three straight portions was $-0.22° \pm 2.36$ (SD of five means) with a range between $-2.8°$ and 3.2°. Because this pitch is small it is possible to use 6.9 μm thick longitudinal and mid-plane sections of straight arteries to obtain estimates of proportional composition. Stereological point counting was used to determine that smooth muscle comprised $72.0\% \pm 4.76$ (SD for ten segments) of the tunica media in cerebral arteries. (32 refs.)

121077 Vascular smooth muscle orientation in curved branches and bifurcations of human cerebral arteries. J.G.Walmsley (Dept. of Biophys., Univ. of Western Ontario, London, Ontario, Canada).
J. Microsc. (GB), vol.131, pt.3, p.377-89 (Sept. 1983).
Two approaches were developed for determining reference axes and positions associated with bending tubular arteries and bifurcations from the human middle cerebral branching system. In the region of the bifurcation the orientation of groups of two-dimensional nuclear vectors was determined by the method of roses and average alignment. The reference axes and positions for these groups were determined from physical reconstructions of two bifurcations. The overall pattern in the bifurcation region was found to be random but there were significant differences between group orientations. The three-dimensional arterial direction vectors for three sections, from the bending arteries of one bifurcation, were determined. By taking the dot product of the three-dimensional nuclear vectors and these direction vectors, the pitch of individual nuclei was determined. The average pitch was $2.45° \pm 3.20$ (SD for $N=8$) with the largest mean pitch (6.14°) in the branch with the greatest curvature. Possible use of the three-dimensional approach for determining of smooth muscle orientation at bifurcations is discussed in general terms. (19 refs.)

121078 A microcomputer system for real-time analysis of cardiac action potentials. D.J.Sheridan, A.J.Bell, W.J.Penny, W.Culling (Dept. of Cardiology, Welsh Nat. School of Medicine, Cardiff, Wales).
J. Med. Eng. & Technol. (GB), vol.7, no.5, p.238-42 (Sept.-Oct. 1983).
A system for performing real-time analysis of cardiac action potentials has been developed using a microcomputer based on the Motorola 6800 central processor. Transmembrane potentials obtained using standard microelectrodes were digitized to 8 bits at 80 ms intervals, stored in cyclic memory buffer from which they could be selected for analysis, converted back to analogue form and displayed on an oscilloscope in real time. For each action potential, amplitude, the maximum rate of change of potential and the action potential duration at 50% repolarization and 100% repolarization were measured. In addition, conduction time (taken as the interval between the stimulus artefact and the action potential) was measured. All data were stored in memory and later printed, together with the time at which the recording was made. The system was designed for analysis of action potentials recorded using floating microelectrodes. The computer was controlled by three remote switches and a potentiometer, positioned close to the music bath. The program was written in Motorola 6800 assembly language and stored in erasable programmable read-only memory. (13 refs.)

121079 A differential capacitive transducer for continuous recording the mass flows through epithelia by immersion weighing. H.Vais (Membrane Biophysics Group, Inst. of Biological Sci., Bucharest, Rumania), D.-G.Margineanu.
J. Biomed. Eng. (GB), vol.5, no.4, p.340-2 (Oct. 1983).
The experimental set-up specifically for recording the weight changes involved in the measurements by immersion weighing of the osmotic and isotopic mass flows through epithelia is described. It allows the conversion of any common mechanical microbalance into a device able to record mass flows at 10^{-6} Kg.m^{-2}.s^{-1} sensitivity. (1 ref.)

121080 A waveguide pulse-echo system for ultrasonic absorption measurements in biological media. B.Woodward (Electronic & Electrical Engng. Dept., Loughborough Univ. of Technol., Loughborough, England).
J. Biomed. Eng. (GB), vol.5, no.4, p.343-8 (Oct. 1983).
The system described has been designed for measurements of ultrasonic absorption in suspensions of biological cells. A novel feature of the design is the provision of a waveguide sample tube which prevents beam diffraction. This ensures that the ultrasonic energy is wholly constrained between a single transducer and a moveable air-backed reflector, and is lost only by absorption in the sample. The associated electronics comprises a simple ultrasonic generator with variable power output, carrier frequency and mark-space ratio,

and a digital thermometer with a thermistor probe for measuring the sample temperature. (14 refs.)

121081 An activity meter. A.Witkowski.
Pol. Tech. Rev. (Poland), no.1, p.15-16 (1983).
An original instrument called the AW-3 activity meter which makes it possible to determine the physiological values of the limiting concentrations of chemical substances for the aquatic organisms being tested is described. The AW-3 meter can be used for testing the motorial reactions to stimuli such as chemical substances, or light. (no refs.)

121082 The use of a versatile specimen holder to prepare cultured cells for scanning electron microscopy. P.Evers, K.Robinson, L.Maistry (Electron Microscope Unit, Univ. of Natal, Durban, S Africa).
Scanning Electron Microsc. (USA), pt.1, p.333-42 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Cells from a human esophageal carcinoma cell line characterized by abundant microvilli and extensive lateral processes were grown on glass coverslips and processed for scanning electron microscopy. In order to reduce possible artifacts related to movement the cultured cells were fixed directly in situ at 37°C and transported for subsequent processing in a specially designed carrier. During dehydration and critical point drying, the cultures were confined in a versatile holder that avoided accidental air drying and required only small volumes of reagents. Flattening of the superficial microvilli on all cells and of processes on mitotic cells was prevented. Extensive fracture of the lateral processes was reduced. Despite the absence of a washing step, debris was minimal and cells of high quality were observed. (14 refs.)

121083 Pumonary macrophage phagocytosis: quantification by secondary and backscattered electron imaging. D.B.Warheit, L.H.Hill, A.R.Brody (Lab. of Pulmonary Function & Toxicology, Nat. Inst. of Environmental Health Sci., Research Triangle Park, NC, USA).
Scanning Electron Microsc. (USA), pt.1, p.431-7 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
A systematic method for quantifying phagocytosis of carbonyl iron heads by pulmonary macrophages is described. These techniques utilize secondary and backscattered electron imaging. The carbonyl iron components has a high atomic contrast number which makes it ideal for visualization in the backscatter electron image of the scanning electron microscope. As a result, interiorized iron beads can easily be distinguished from beads attached to the surface of the cell. The morphology and phagocytic capacities of individual macrophages were compared. The results showed that functional heterogeneity exists within the normal pulmonary macrophage population. Ruffled macrophages avidly phagocytized carbonyl iron beads, while smooth cells were functionally impaired. In addition, macrophages which were altered morphologically by exposures to acidic culture conditions or to asbestos demonstrated a decreased capacity to phagocytize carbonyl iron beads. Accordingly, the surface morphology of pulmonary macrophages correlated with their phagocytic capacities. The authors propose that results obtained from the analyses of individual cells can be used to study the phagocytic capacity of macrophage populations. (15 refs.)

121084 Mechanical characterization of membranelike biological tissue. L.E.Thibault (Dept. of Bioengng., Univ. of Pennsylvania, Philadelphia, PA, USA), D.L.Fry.
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.31-8 (Feb. 1983). [received: Oct. 1983]
Experimental and analytical methods are presented which enable one to examine the local rheological properties of biological tissues which can be captured as flat sheets between matching pressure manifolds and deformed under experimentally prescribed hydrostatic loading conditions. In spite of the fact that most biological tissues, including arteries, are nonlinearly elastic when considered over wide ranges of strain, it was found that the deformation of swine and canine arterial wall specimens in the physiological range of wall strain can be approximated by an isotropic, linearly elastic membrane model. In view of this, the elastic behaviour was characterized approximately by an incremental modulus in both species was shown to increase by a factor of three along the descending thoracic aorta from the ductus scar to the celiac orifice. (8 refs.)

121085 Determination of the local erosion stress of the canine endothelium using a jet impingement method. R.N.Vaishnav, D.J.Patel, H.B.Atabek, M.D.Deshpande, F.Plowman, J.Vossoughi (School of Engng. & Architecture, Catholic Univ. of America, Washington, DC, USA).
Trans. ASME. J. Biomech. Eng. (USA), vol.105, no.1, p.77-83 (Feb. 1983). [received: Oct. 1983]
A method to determine local endothelial erosion stress is presented. Freshly excised segments of middle descending thoracic aortas of dogs were slit open longitudinally and stretched in a specially designed rack to various circumferential and longitudinal dimensions. Jets of physiological saline were impinged normally on the endothelium of these segments. Lesions caused by the jet were made visible by staining the tissue with Evans blue dye. The dye solution was absorbed by regions where the endothelial layer had been damaged or destroyed. Characteristically, the lesions were annular in shape. This indicates that the endothelium can withstand large normal stresses where the jet impinges, but is eroded by the shear stress resulting from the jet efflux. Erosion stress of the endothelium was determined by correlating the external radius of a lesion with the shear stress expected at that radial distance from the center of the jet. The importance of the method is its ability to measure local endothelial erosion stress which is of particular significance in the study of the discrete process of atherogenesis. (17 refs.)

121086 The improvement and quantitative assessment of B-mode images produced by an annular array/cone hybrid. M.S.Patterson, F.S.Foster (Dept. of Medical Biophys., Univ. of Toronto, Toronto, Ontario, Canada).
Ultrason. Imaging (USA), vol.5, no.3, p.195-213 (July 1983).
Hybrid ultrasound imaging systems, which combine spherical focusing on transmit with axicon focusing on receive, provide excellent resolution over a useful depth of field. The authors present a new hybrid design with improved sensitivity, in which the axicon focusing is achieved by two conical mirrors and a PZT 5A disk cut into 8 sectors. The authors have investigated two methods of processing the signals from the 8 sectors. In the first, phase insensitive sector addition (PISA), the B-scan is formed from the sum of the 8 demodulated signals. In the second, multiplicative processing (MP), the 8 RF waveforms are multiplied and the resultant is demodulated to form the image. Both techniques result in smoothed speckle but degraded lateral resolution. As well, MP decreases the off-axis sensitivity of the system and artifacts characteristic of axicon focusing. Quantitative assessment of the effects of PISA and MP was performed using a new approach called contrast-to-speckle ratio (CSR). The CSR data, which is a measure of the image contrast of cylindrical voids in a random scattering medium relative to contrast fluctuations due to speckle, shows the superiority of PISA and MP. This conclusion is supported by images of in vitro human breast tissue. (23 refs.)

121087 On the existence and singularity of a potential in the inverse problem with a priori information on source distribution. M.A.Brodskiy, N.S.Nadirashvili (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.591-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli,* vol.18, no.8 (1982). [received: Sept. 1983]
Conditions studied under which a harmonic function in free space is an external potential of masses with positive density. A number of theorems are obtained for the uniqueness of determining these masses and for approximation methods for their external fields. (10 refs.)

121088 The rotation of the ocean-solid Earth system. S.R.Dickman (Dept. of Geological Sci., State Univ. of New York, Binghamton, NY, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6373-94 (10 Aug. 1983).
It is shown that the long-period, highly elliptical Markowitz wobble can be viewed as a natural wobble of the coupled mantle-ocean system. From a rotational point of view, oceanic wobble is possible even if the oceans respond in an equilibrium a manner to wobble because the oceans are nonglobal and a thin layer; either of the latter conditions, or an oceanic response which is nonequilibrium, can maintain the separation of rotation and figure axes constituting wobble. Characteristics of the uncoupled bodies are first determined. The inertia tensor of the oceans yields an oceanic body whose free wobble is retrograde and short period under the assumption of an equilibrium fluid response; it also yields an oceanless earth whose precessional constant more nearly equals the hydrostatic rather than the observed whole Earth value. The equations governing wobbles of a coupled two-body system, rigid or deformable, are developed and referred to the same wobbling coordinate system. Solutions are found for various general types of coupling. (39 refs.)

121089 Map projection transformation with digitally controlled differential rectifiers. G.E.Bormann (Wild Heerbrugg Ltd., Heerbrugg, Switzerland), E.Vozikis.
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.9, p.1317-23 (Sept. 1983).
The geometrically correct transformation of the entire map content from one cartographic projection to another is an old problem. It can be solved economically with digitally-controlled differential rectifiers such as the Wild AVIOPLAN OR1, using additional software modules. Examples illustrate the potential of this method and show also the great advantages of the color capability of the OR1 system. (3 refs.)

121090 Modelling of vertical crustal movements by means of collocation. E.Kanngieser.
Z. Vermessungswes. (Germany), vol.108, no.9, p.373-81 (Sept. 1983). In German.
The proposed technique utilizes least-squares collocation for producing a common and continuous model of vertical crustal movements. The data used are the results of repeated levellings and precise gravity measurements. A position-time system is the reference for the sample points where height and/or gravity have been observed. The necessary covariance functions have been determined empirically, analyzed regarding the isotropy and used for the prediction of the variations. The developed algorithm has been applied successfully to data obtained in a geodynamic test field in Iceland. (23 refs.)

121091 Unbiased estimation of variance-covariance components in condition adjustment with unknowns—a MINQUE approach. L.E.Sjoberg (Dept. of Geodetic Sci., Stuttgart Univ., Stuttgart, Germany).
Z. Vermessungswes. (Germany), vol.108, no.9, p.382-7 (Sept. 1983).
The MINQUE Theory of variance-covariance component estimation is extended to condition adjustment with unknowns. Estimation by the general

Gauss-Markov model and by the condition adjustment model come out as special cases. (8 refs.)

121092 The influence of non-orthogonal eccentric theodolite axes on the circle readings. G.Brandstatter.
Z. Vermessungswes. (Germany), vol.108, no.9, p.387-93 (Sept. 1983). In German.
In the case of eccentric theodolite axes the reading errors differ from the reading errors of the usual centric constructions. This effect is derived for the case of eccentricities in all directions by vector calculus, and scalar equations of the influence in vertical and horizontal circle readings are given. Finally the equations are specialized for two typical cases. (5 refs.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

121093 Inversion of geophysical electromagnetic measurements, limitations and approximate solutions. S.-E.Hjelt.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.58-62 (1983).
The paper presents a brief summary of the main limitations of inverting electromagnetic (EM) data into useful descriptions of the Earth and its structures. Problems of modelling, uniqueness and resolution are stated. Despite theoretical shortcomings, approximate inversion procedures are useful in the practical use of EM methods. Analog principles can be used to extend the domain of existing model solutions, the theory of images to calculate approximate responses of good conductors and apparent current distributions to model real structures of the Earth. (18 refs.)

121094 New paleomagnetic data for the Triassic Guichon batholith of south-central British Columbia and their bearing on Terrane I tectonics. D.T.A.Symons (Dept. of Geology, Univ. of Windsor, Windsor, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1340-4 (Aug. 1983).
The 198 Ma Guichon batholith outcrops in the southern end of the Intermontane Belt or composite Terrane I of the western North American Cordillera. Thermal demagnetization of specimens isolates a stable primary component giving a pole position of 347°W, 52°N. These data support earlier results that indicate the batholith has undergone a clockwise rotation about a vertical axis of $\sim 43 \pm 7°$. They also show that the batholith has undergone northward motion of $13 \pm 6°$, which supports recent arguments that the terrain underwent $14 \pm 2°$ of northward translation between Late Cretaceous and pre-Miocene time. (40 refs.)

121095 Late Cretaceous apparent polar wander of the Pacific plate: evidence for a rapid shift of the Pacific hotspots with respect to the spin axis. R.G.Gordon (Dept. of Geological Sci., Northwestern Univ., Evanston, IL, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.709-12 (1983).
Paleomagnetic data from the Pacific plate show that the average azimuth of the Pacific plate decreased by $\sim 12°$ between 90 Ma and 81 Ma, whereas trends of Late Cretaceous seamount chains suggest that the Pacific plate moved northwestward relative to the hotspots with little change in azimuth during the same time interval. This difference is used to infer a $13° \pm 4°$ shift of the spin axis relative to the hotspots in the Pacific Ocean basin. This shift occurred within 5 m.y. of the occurrence of anomalous behavior of the paleomagnetic field recorded in anomalies 33 and 34. This coincidence in timing suggests there may be a causal link between these three phenomena. (30 refs.)

121096 Matching long term periodicities of geomagnetic reversals and galactic motions of the solar system. J.G.Negi, R.K.Tiwari (Nat. Geophys. Res. Inst., Hyderabad, India).
Geophys. Res. Lett. (USA), vol.10, no.8, p.713-16 (1983).
To understand the phenomenon of frequent reversals of axial geocentric dipole fields it is essential to understand the spectral structure of geomagnetic reversal series and search for possible exogenetic (cosmic) factors associated with its dynamic behaviour. A scheme of Walsh spectrum analysis has been applied, for the first time, to the available world-wide paleomagnetic measurements during Phanerozoic (last 570 million years). The results postulate long-term cyclicity in magnetic stratigraphy with reversal periods of 285, 114, 64, 47 and 34 million years with distinct resolution. The similar analysis was further repeated by dividing the total record in two sub-series. These results indicate mean periods of 71, 47 and 32 m.y. The maximum spectral power is found for the Cosmic year (285 m.y.) Term (period of complete revolution of solar system around the Milky way galactic centre). (21 refs.)

121097 Annual report for magnetic observatories—1981. G.jansenvan-Beek.Jansen van Beek,G., R.L.Coles.
Geomagn. Ser. Earth Phys. Branch (Canada), no.24, p.1-54 (1983). In English, French.
The Canadian Magnetic Observatory Network in 1981 consisted of 12 observatories with the Automatic Magnetic Observatory System (AMOS) in operation at all sites except Alert and Mould Bay. All observatories now record the orthogonal elements X(north), Y(east), and Z(vertical), although back-up systems are maintained in H,D,Z for reasons of continuity at the Kp and Kn observatories. The Telephone Verification System (TVS) is available for monitoring data from all AMOS sites. A digital back-up system for AMOS was in operation at all stations. The location, method of recording, and data of commencement of the observatories are given. The geomagnetic values recorded during 1981 are presented in this report. (12 refs.)

121098 Study of the temporal dynamics of the Manchazh regional magnetic anomaly. V.A.Shapiro (Inst. of Geophys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.598-606 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]
Results are presented for geomagnetic studies of the Manchazh regional magnetic anomaly in 1959-79. This was a repeat aeromagnetic survey. The author discusses ground T-observations along a grid of reference points—1968-79, observations at the ARti and Vyskaya Dubrava Observatories-1968-79, and synchronous magnetovariational observations of T at four points: the anomaly epicenter, the Arti Observatory, and at two points in the normal field-1974 and 1977. It is shown that the anomalous magnetic field in the Machazh anomaly increased in the course of 20 years at a rate on the order of 5 (nanoteslas) per year and that the anomaly was caused by a rock mass lying at a depth of 10-40 km and having generally remanent magnetization, the direction of which coincides with the direction of the contemporary mangetic field. (21 refs.)

121099 Effect of deep fractures on the resolution capacity of magnetotelluric sounding. V.I.Dmitriyev, M.N.Berdichevskiy, I.S.Barashkov, N.A.Lebedeva (M.N. Lomonosov Moscow State Univ., Moscow, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8, p.623-4 (1982). [received: Sept. 1983]
A two-dimensional model is considered which simulates the crustal conducting zone crossed by deep fractures. High resolution capability is indicated for magnetotelluric sounding. (1 ref.)

121100 Energy characteristics of non-homogeneous planar electromagnetic waves. V.B.Shaub, N.N.Barinov, S.S.Starzhinskiy (Pacific Ocean Oceanographic Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8, p.625-8 (1982). [received: Sept. 1983]
The electrical characteristics are considered for electrical and magnetic modes of non-homogeneous planar waves in a magnetotelluric field. Based on the experimental data, it is indicated that the directions and absolute values of group velocities for these modes differ considerably in some realizations, while in others they are rather close to one another, which is evidence for a differing degree of correspondence for these realizations to models for non-homogeneous planar waves. (6 refs.)

121101 The problem of constructing a magnetic model of the Earth's crust as illustrated by a latitudinal traverse of the Urals. V.A.Shapiro, A.V.Tsirul'skiy, F.I.Nikonova, N.V.Fedorova, O.Ya.Belyayeva, L.O.Tyurmina, A.V.Chursin (Geophys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.672-80 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
Methodological questions arising during the construction of a magnetic model of the Earth's crust are discussed: the determination of the anomalous magnetic field, the choice of the model of the principal geomagnetic field, the interpretation of magnetic anomalies. The results of the construction of a model of a magnetically active layer along the Gayna-Gornopravdinsk geotraverse, which is 900 km long and intersects the main structures of the Urals, are presented. The necessity of taking equivalence into account in the inverse problem of magnetometry is stressed. (19 refs.)

121102 Equivalent ionospheric current systems representing lunar daily variations of the polar geomagnetic field. S.Matsushita, Wen-Yao Xu (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7143-54 (1 Sept. 1983).
Equivalent ionospheric current systems of the lunar daily geomagnetic variations at both high and mid-low latitudes during a solar active period are estimated from geomagnetic data for three seasons and the yearly average. Clear convective currents at high latitudes are found in addition to the well-known mid-low latitude current system. Field-aligned electric currents as well as the wind dynamo effects which produce the obtained electric current systems for the semidiurnal variation are examined. It is concluded that the wind dynamo plays a basic role in producing the current system at high latitudes, since lunar effects on the field-aligned current distribution are difficult to explain. (21 refs.)

121103 A Pennsylvanian paleomagnetic pole from the mineralized Late Cambrian Bonneterre Formation, southeast Missouri. M.J.Wisniowiecki, R.Van der Voo, C.McCabe, W.C.Kelly (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6540-8 (10 Aug. 1983).
One hundred eighty-eight oriented samples of the Late Cambrian Bonneterre carbonates of southeastern Missouri were taken from Viburnum Trend mines and local surface outcrops. Initial natural remanent magnetization directions have south-southeasterly declinations and downward inclinations. Progressive demagnetizations using thermal and AF techniques give two directions: one is a viscous present-day field direction, and the other is of reversed polarity, with south-southeasterly declinations and very shallow inclinations. The resulting paleopole, at 43°N, 126°E, is located near the Pennsylvanian to Early Permian segment of the North American apparent polar wander path. A negative conglomerate test supports this assignment for the magnetization age. (36 refs.)

121104 Palaeomagnetism of Lower Cretaceous tuffs from Yukon-Kuskokwim delta region, western Alaska. B.R.Globerman, R.S.Coe, J.M.Hoare, J.Decker (Earth Sci. Board, Univ. of California, Santa Cruz, CA, USA).
Nature (GB), vol.305, no.5934, p.516-20 (6 Oct. 1983).
New palaeomagnetic results are reported from tuffs and associated volcaniclastic rocks of early Cretaceous age from the Yukon-Kuskokwim delta region in western Alaska. These rocks were probably overprinted during the Cretaceous long normal polarity interval. This overprint direction is not appreciably discordant from the expected late Cretaceous direction for cratonal North America. The implied absence of appreciable northward displacement for this region is consistent with the general late Mesozoic-early Tertiary tectonic pattern for Alaska, based on more definitive studies: little to no poleward displacement for central Alaska, though substantially more northward drift for the 'southern Alaska terranes' (comprising Alaska Peninsula, Kodiak Island, Prince William Sound area, and Matunuska Valley) since late Cretaceous to Palaeocene time. (43 refs.)

91.30 SEISMOLOGY

121105 Energy radiation from a spherically symmetric homogeneous source. J.W.Rudnicki (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.901-8 (Aug. 1983).
General expressions for energy radiated from seismic sources in linear elastic bodies are illustrated and clarified by examining the energy radiated from a spherically symmetric source. Calculations with the spherical source demonstrate that the point source approximation for the radiated energy is not asymptotic in the sense that it does not approach the actual radiated energy for small source dimension. Comparison between the energies radiated from the spherical source for a ramp time function and for a modulated ramp is discussed. (12 refs.)

121106 On the Green's functions for a layered half-space. I. J.E.Luco (Dept. of Appl. Mech., Univ. of California, La Jolla, CA, USA), J.Apsel.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.909-29 (Aug. 1983).
A method to calculate the dynamic three-dimensional response of a layered half-space to an arbitrary buried source is presented. The frequency-domain formulation is based on representing the complete response in terms of semi-infinite integrals with respect to wavenumber after expansion in a Fourier series with respect to azimuth. The integrands for each wavenumber and frequency are determined by an efficient factorization in terms of generalized transmission and reflection coefficients which are calculated by an iterative scheme. Time-domain results may be obtained by Fourier synthesis over frequency. (26 refs.)

121107 On the Green's functions for a layered half-space. II. R.J.Apsel (Sierra Geophys. Inc., Redmond, WA, USA), J.E.Luco.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.931-51 (Aug. 1983).
For pt.I see ibid., vol.73, no.4, p.909-29 (1983). A numerical procedure to obtain the dynamic Green's functions for layered viscoelastic media is presented. The procedure is based on numerical evaluation of certain Hankel-type integrals which appear in an integral representation derived by Luco and Apsel (1983). Comparisons illustrating the accuracy and flexibility of the approach are made with a number of solutions obtained by other methods. (10 refs.)

121108 A specific barrier model for the quantitative description of inhomogeneous faulting and the prediction of strong ground motion. II. Applications of the model. A.S.Papageorgiou, K.Aki.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.953-78 (Aug. 1983).
For pt.I see ibid., vol.73, no.3, p.693-722 (1983). The specific barrier model, which was described in detail by Papageorgiou and Aki (1983), is applied to a set of five moderate to strong Californian earthquakes: Kern County (1952); San Fernando (1971); Borrego Mountain (1968); Long Beach (1933); and Parkfield (1966). Source parameters such as barrier intervals, local stress drops, cohesive zone size, and cohesive stress are inferred. The cut-off frequency observed on the source acceleration power spectra of all the events analyzed, is interpreted in terms of the cohesive zone size and cohesive stress which arrest the localized fractures that occur on the fault plane. The relation between barrier interval and maximum slip which has been observed by Aki et al. (1977) is verified. (49 refs.)

121109 Source characterization of bermed surface bursts. B.W.Stump.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.979-1003 (Aug. 1983).
A source characterization of bermed surface bursts utilizing vertical and horizontal point sources is developed. The equivalence of this formulation with a radial force couple and vertical point force is shown. This representation is formulated so that with analytic propagation path models and observational data, inverse techniques can be applied and the source estimated. The inverse procedure is appled to the Pre-HYBRID GUST 1-04, 05, and 06 data sets (13.6 kg for 04, 13.6 kg for 05, and 39 kg for 06 of sand bermed C-4). (20 refs.)

121110 The apparent attenuation of a scattering medium. P.G.Richards, W.Menke (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1005-21 (Aug. 1983).
Reports the results of some numerical experiments that bring out the low-pass characteristics of a purely elastic medium with a heterogeneous velocity structure. Although the typical fluctuation is spatially confined within less than a wavelength, waves propagating over a sufficiently long path suffer major cumulative effects. The authors summarize the removal of high frequencies during transmission by a frequency-independent apparent Q, and show that attenuation by intrinsic friction and scattering are approximately additive. The authors propose some diagnostics that might help to distinguish the presence of velocity fluctuations and resultant scattering from the presence of anelasticity and true dissipation. The authors also outline several topics in the theory of wave propagation that will be relevant in a satisfactory interpretation of short-period observations, if the amplitude of such signals is affected by scattering. (25 refs.)

121111 Generalization of Higuchi's conditions for Love waves propagating through two welded quarter-spaces with two surface layers on each. M.H.Kazi, A.Niazy (Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1023-30 (Aug. 1983).
Higuchi (1932) considered a medium consisting of two quarter-spaces in welded contact, each having a single homogeneous layer of the same thickness overlying a homogeneous half-space, and gave conditions on the rigidities and densities of the two layers and two half-spaces in such a way that the plane Love waves normally incident on the vertical plane generate only reflected and transmitted Love waves without mode conversion or body-wave scattering. The authors generalize Higuchi's results to two layers overlying a half-space divided by a vertical plane. (8 refs.)

121112 *Lg* spectra of local earthquakes recorded by the Eastern Canada Telemetered Network and spectral scaling. H.S.Hasegawa (Div. of Seismology & Geomagnetism, Energy, Mines & Resources, Ottawa, Ontario, Canada).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1041-61 (Aug. 1983).
A spectral analysis of more than 300 Eastern Canada Telemetered Network records of the *Lg* wave from 103 eastern Canada earthquakes is undertaken to determine source characteristics. Both seismic moment and corner frequency of smaller magnitude ($1 \leq M \leq 4.2$) earthquakes increase more gradually with increasing magnitude (M stands for m_{bLg}) than do corresponding parameters for larger ($4.2 < M \leq 6.6$) earthquakes. For smaller and larger earthquakes, empirical relations are presented. (39 refs.)

121113 Body-wave amplitude and travel-time correlations across North America. T.Lay, D.V.Helmberger (Seismological Lab., Californian Inst. of Technol., Pasadena, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1063-76 (Aug. 1983).
Relationships between travel-time and amplitude station anomalies are examined for short- and long-period *SH* waves and short-period *P*-waves recorded at North American WWSSN and Canadian Seismic Network stations. Data for two azimuths of approach to North America are analyzed. To facilitate intercomparison of the data, the *S*-wave travel times and amplitudes are measured from the same records, and the amplitude data processing is similar for both *P* and *S* waves. (28 refs.)

121114 Bayesian analysis of extreme earthquake occurrences. II. Application to the San Jacinto fault zone of southern California. K.W.Campbell (TERA Corp., Berkeley, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1099-115 (Aug. 1983).
For pt.I see ibid., vol.72, no.5, p.1689-705 (1982). The Bayesian extreme-value distribution of earthquake occurrences developed in Campbell (1982), is tested and applied to the estimation of seismic hazards for the San Jacinto fault zone of southern California. Prior estimates of seismicity are developed from seismotectonic data based on standard seismological relationships among seismic moment, slip rate, earthquake recurrence rate, and magnitude. These estimates are then updated using Bayes' theorem and historical estimates of seismicity associated with the San Jacinto fault zone. (48 refs.)

121115 Seismicity in the St. Elias region of northwestern Canada and southeastern Alaska. R.B.Horner (Dept. of Energy, Mines & Resources, Pacific Geosci. Centre, British Columbia, Canada).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1117-37 (Aug. 1983).
Examines seismicity patterns in the St. Elias region in relation to the major tectonic features. Zones of earthquake occurrence are defined both spatially and temporally on the basis of historical activity and, particularly along the Denali system in the southwest Yukon, low-level monitoring and microearthquake activity. An estimate is made of the slip rate and accumulated elastic strain. (42 refs.)

121116 A study of the 20 January 1982 earthquake near Great Nicobar Island, India. P.N.Agrawal (Dept. of Earthquake Engng., Univ. of Roorkee, Roorkee, India).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1139-59 (Aug. 1983).
An earthquake of $M_s = 6.3$ occurred on 20 January 1982 near the east coast of Great Nicobar Island (in the Bay of Bengal), India and caused great panic among the inhabitants. Ground fissures and damage to civil engineering structures was also caused. A study comprised of the recording of aftershocks and their migration, the preparation of an isoseismal maps, and the compilation of other damage data is presented. Some recommendations are made to permit suitable safeguards in future development. (8 refs.)

121117 A teleseism-specific detection algorithm for single short-period traces. J.R.Evans (US Geological Survey Office of Earthquake Studies, Menlo Park, CA, USA), S.S.Allen.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1173-86 (Aug. 1983).
An algorithm for microprocessor-controlled seismographic recorders is described which realiably detects major phases from earthquakes more than 3° from the sensor but rejects noise events and most earthquakes closer than 3°. Unusually large earthquakes within 3° also are detected. The algorithm is applicable to field studies using triggered seismographs to record teleseismic *P*-waves, to worldwide network automation, and to scanning records for teleseisms. It uses two band-pass filtered data streams evolved from a single short-period vertical-component seismometer to differentiate (low-frequency) teleseisms from other signals; the low-frequency band (0.5 to 2.0 Hz) declares 'triggers' while the high-frequency band (3.0 to 8.0 Hz) inhibits any of these triggers generated by broadband signals such as local earthquakes. (22 refs.)

121118 Microfilming of historical seismograms from the Mount Hamilton (Lick) Seismographic Station. R.A.Uhrhammer (Seismographic Station, Univ. of California, Berkeley, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1197-202 (Aug. 1983).
The seismograms from the Mount Hamilton, California, seismographic station were microfilmed as part of the Historical Seismogram Filming Project. All of the available smoked paper and photographic seismograms from the Mount Hamilton station (more than 35000 from 6 June 1911 through 30 June 1962) were prepared and microfilmed onsite at the University of California, Berkeley. The preparation time averaged 2 man-minutes/seismogram, and the overall cost averaged out to $1.05/seismogram. (7 refs.)

121119 Uncertainties in probabilistic seismic hazard assessment as a function of probability level: a case history for Vancouver, British Columbia. G.M.Atkinson, R.G.Charlwood (Klohn Leonoff Consulting Engnrs., Richmond, Canada).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1225-41 (Aug. 1983).
The stability of probabilistic methods of evaluating expected strong ground motion levels is examined as a function of probability level. A case history for Vancouver, British Columbia, is used to show that when input parameters are screened on the basis of compatibility with low probability calculations, robust (±25 per cent) results are obtained for probabilities in the range of 10^{-2} to 10^{-4} per annum. There is no inherent loss of stability with decreasing probability. Probabilistic approaches are not in conflict with deterministic approaches, since deterministic data can be incorporated into the analysis.

The usefulness of the probabilistic approach lies in providing a framework for evaluating uncertainties. (23 refs.)

121120 Mode of strain release of three graben-associated earthquakes. W.-Y.Chung (Dept. of Geology, Univ. of South Carolina, Columbia, SC, USA).
Tectonics (USA), vol.2, no.4, p.379-98 (Aug. 1983).
The nature of graben-associated earthquakes sequences using various seismological, geophysical and geological data. The three earthquake sequences are the Hsingtai, China earthquakes (maximum magnitude Ms=7.2) of March, 1966, the Nevada earthquakes (maximum M=7.1) of 1954, and the New Madrid earthquakes (maximum Ms=8.8) of 1811-12. These earthquake sequences represent a unique mode of strain release away from plate margins and have bearings on earthquake hazard evaluation. Similarities between these earthquake sequences are studied. It is noted that the largest shock in a sequence is not usually the first one. Epicentre migration occurred in two of these sequences. (73 refs.)

121121 Crosshole seismology and seismic imaging in crystalline rocks. J.Wong, P.Hurley, G.F.West (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Geophys. Res. Lett. (USA), vol.10, no.8, p.686-9 (1983).
A borehole-to-borehole audiofrequency seismic system using piezoelectric transducers as active elements has been developed and used to investigate crystalline rocks in Canada. High-quality seismograms have been recorded for transmitter-receiver distances of up to 230 meters. It has been found that both travel times and signal amplitudes provide diagnostic information about rock quality. Two-dimensional images of seismic velocity and transparency distributions between two boreholes, derived from observed arrival times and amplitudes by simple back-projection tomography, reflect lithology and geological structure. The results indicate the potential usefulness of crosshole seismic imaging as a tool for rock mass characterization. (16 refs.)

121122 Local earthquakes on three-component seismographs: heterogeneity in the aftershock zone of El Asnam, Algeria (10.10.1980, M=7.3). A.Nercessian, M.Sapin, A.Hirn (Lab. d'Etude Geophys. de Structures Profondes, Univ. Pierre et Marie Curie, Paris, France), G.Wittlinger, M.Djeddi.
Geophys. Res. Lett. (USA), vol.10, no.8, p.69306 (1983).
Seismograms of aftershocks of the El Asnam earthquake recorded by three-component stations of a local array provide direct evidence of structural heterogeneity in the after shock zone. Inversion of arrival times for three dimensional velocity structure is thus needed for the relocation of hypocenters. These fall within a reduced depth interval from 6 to 12 km in the underthrust block. (8 refs.)

121123 Outer-rise earthquakes and seismic coupling. D.H.Christensen, L.J.Ruff (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.697-700 (1983).
Outer-rise earthquakes can be separated into two basic categories based on focal mechanism: compressional and tensional events reflecting compressional and tensional outer-rise stress regimes. A model is proposed that connects the stress regime in the outer-rise to the behavior of large subduction earthquakes and explains the focal mechanisms and both the temporal and spatial occurrence of outer-rise earthquakes. Compressional outer-rise events tend to occur oceanward of seismic gaps in seismically coupled subduction zones, or equivalently just prior to large subduction zone earthquakes. The compressional stress regime is probably caused by slip in adjacent subduction zone segments. There are two modes of occurrence for tensional outer-rise earthquakes depending on whether they occur in coupled or uncoupled subduction zones. (17 refs.)

121124 Walsh transforms in seismic-event detection. S.K.Fletcher (Systems Res. Div., Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Electromagn. Compat. (USA), vol.EMC-25, no.3, pt.2, p.367-9 (Aug. 1983).
Several approaches to detecting event signals in background noise are presented, and Walsh transforms are shown to be an efficient tool in implementing some of these. An experiment is reported in which four categories of detectors are represented, two using Walsh transforms in their implementation. The two Walsh-based detectors and one other have some capability of recognizing a spectral change in the data; these three outperformed a simple power detector in detecting low-level events. Of the three, the two Walsh-based ones have faster execution speed. Although these experimental results are for seismic signals and background, the usefulness of Walsh-transform-based detectors may extend to many other applications as well. (14 refs.)

121125 The physical model of the sources of deep-focus earthquakes. V.A.Kalinin, M.V.Rodkin (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.555-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]
A critical analysis is made of the existing models of the source of deep-focus earthquakes. A new source model is proposed which is based on superplastic properties of matter manifested in polymorphic transitions. The model satisfies all the characteristic features of deep seismicity and predicts the existence of a critical subduction velocity that determines the possibility of occurrence of deep-focus earthquakes in a subducting plate. (60 refs.)

121126 Forecast time stability of strong earthquake areas. I. Southeast Europe and Asia Minor. A.D.Gvishiani (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8, p.562-6 (1982). [received: Sept. 1983]
The necessary requirement of forecast time stability of strong earthquake sites is formulated, which postulates that a forecast should not be changed with admissible changes of input data. Mathematical propositions testing this requirement are proved. On this basis, time stability is established for the forecast of the location of epicenters of earthquakes with $M \geq 7.0$ in Southeast Europe and Asia Minor. (14 refs.)

121127 The development of travel time curves and time fields. N.N.Puzyrev (Inst. of Geology & Geophys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.743-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The evolution of travel time curves and time fields in seismic prospecting and seismology is examined. The complex observation systems now in use require a broadened concept of the time field and the corresponding travel time curves. The author sets forth the theory of generalized time fields and the corresponding generalized travel time curves. According to this theory, the previously used representation of a time field with a fixed source is a specific case of a time field of the zero order. (10 refs.)

121128 The theory of kinematic interpretation of seismic prospecting data. S.V.Gol'din (Inst. of Geology & Geophys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.748-51 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The development of the theory of kinematic interpretation of seismic prospecting data from the classic works of Riznichenko to the present (1980) is examined. (18 refs.)

121129 Relationships between velocity functions and travel time curves. M.E.Romanov, V.A.Sharafutdinov (Calculation Center, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.752-3 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
Several new correlations between the velocity of a two-dimensionally-inhomogeneous medium and the corresponding travel-time curve are presented, as well as some integral correlations in kinematic seismic problems. Results are of interest for solutions of direct and inverse seismic problems. (1 ref.)

121130 Scattering and absorption of longitudinal seismic waves in the Earth's crust. M.V.Nevskii, A.V.Nikolayev, O.Yu.Riznichenko (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.754-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
A new approach is developed for estimating losses due to scattering in longitudinal seismic waves, based on a study of fluctuations of the wave field of initial *P*-waves for given observations in the area of seismic groups. Independent estimates of scattering coefficients are obtained for longitudinal seismic waves in the crystalline crust in a frequency band of 1-50 Hz. The predominating role of scattering effects with relation to absorption is established. (17 refs.)

121131 Conditions at the rupture and spectra of the waves emitted by it. S.D.Vinogradov (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.770-3 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
An experimental study is conducted of the spectra of waves from a shear fault with different roughnesses of the sides. The roughness of the fault plane is simulated by point adhesions with varying steps between adhesions. The shape of the pulses emitted and their spectrum depend substantially on the presence of adhesions and the step between them. The possibility is discussed of applying the findings of the study to interpretation of seismic data. (12 refs.)

121132 Model studies of the elastic wave field and residual strains caused by a shear fault. O.G.Shamina, A.A.Pavlov, R.V.Khanutina (O.Yu. Schmidt Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.774-80 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
Laboratory studies of a shear movement along an existing crack are described. A movement of overthrust type along a fault occurring under conditions of horizontal compression is modeled. The directivity of the longitudinal wave radiation is investigated, and the dynamic displacements and residual strains on the free surface are measured. The results are used for an interpretation of seismological data concerning the difference between the radiation of compression and tension waves. (7 refs.)

121133 Statistical analysis of the earthquakes of Europe. Z.Shenkova, V.Karnik (Inst. of Geophys., Acad. of Sci., Prague, Czechoslovakia).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.790-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The statistical characteristics of the seismology of the European region are examined. The regularity of appearance of large events is well described by Poisson's process and by the theory of largest values; however, events of medium or small magnitude are modeled out better by a negative binomial expression. (16 refs.)

121134 Certain aspects of the seismic 'climate and weather' in the Transcarpathian region. R.S.Pronishin, B.G.Pustovitenko (S.I. Subbotin Geophys. Inst., Acad. of Sci., Ukrainian SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.795-801 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The long-term characteristics of the seismic climate in the region, their special features and the patterns of their variation in space and in time are considered. It is shown that there are differences in the seismic regime in different parts of the region and that the regime fluctuates in time. Certain patterns of development of the seismic process over a period of 200 years and during the last 20 years are established. An analysis is made of the seismic weather conditions during the period of preparation of strong earthquakes of the Transcarpathian region in 1979. (11 refs.)

121135 A comparative analysis of shakability graphs for certain objects in Tadzhikistan. R.S.Mikhaylova, K.M.Mirzoyev, T.A.Kinyapina, R.V.Dubinina (Inst. of Earthquake Resistant Construction & Seismology, Acad. of Sci., Tadzhik SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.802-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
An attempt is made to choose the most reliable model of the focal seismicity of the territory of the Tadzhik SSR on the basis of a comparison of the calculated and observed shakabilities at a number of points. It is ascertained that at different points the observations agree in different ways with the results of calculations according to the adopted models of focal seismicity. (25 refs.)

121136 Seismic oscillations of the Earth's surface as a function of local conditions. A.A.Gvozdev, N.V.Zvolinskiy, A.N.Kovshov (Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.650-64 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
A survey is made of works dealing with the solution of problems concerning the effect of local conditions (the thickness of the loose soil layer, the relief, etc.) on oscillations of the Earth's surface during earthquakes. Attention is paid to the choice of the relations which describe the inelastic properties of the soil. (68 refs.)

121137 Time stability of a prediction of sites of strong earthquakes. II. The eastern part of Central Asia. A.D.Gvishiani, V.A.Gurvich (O.Yu. Schmidt Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.665-71 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
For pt.I see Izvestiya Akad. Nauk SSSR, Fizika Zemli, no.8, p.13-19 (1982). The prediction of sites where the epicentres of strong earthquakes may be located is treated as a pattern recognition problem. A special feature of this problem is that the partitioning of recognition objects into classes varies with the passage of time. This makes it possible to impose on a prediction the requirement of stability in time and thus greatly narrow the range of classifications claiming the role of a prediction. Within the framework of the general theory of pattern recognition a class of dynamic recognition problems is determined, the characteristic feature of which is the dependence of the classification of the objects on time. A definition of a stable prediction for a dynamic problem is given, and a stability criterion is derived for a prediction obtained by a VEC recognition algorithm. With the aid of these results the stability of a prediction of sites in the eastern part of Central Asia, where the epicenters of earthquakes with a magnitude $M \geq 6.5$ may be located, is demonstrated. (6 refs.)

121138 Effective conductivity of anisotropic medium with large number of cracks. V.I.Selyakov (Moscow Inst. of Engng. Phys., Moscow, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.690-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
The plane problem of conductivity of an anisotropic medium with elliptical-shaped inclusions is considered in the case in which the concentration of the inclusions is not small. Analytical dependences of the effective conductivity of the medium on the concentration and length of the cracks are obtained. An increase in effective conductivity of the medium due to increase in length of the cracks alone without change in their volume is shown to be possible. (9 refs.)

121139 A very powerful earthquake in the Greater Caucasus Mountains, January 14, 1668. A.A.Nikonov (Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.713-25 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
Newly discovered sources are cited which describe the earthquake of 1668 in the Eastern Caucasus as the strongest of the known quakes. The dates of the earthquake and after shocks are identified more precisely, and uncertainties and contradictions in the catalogues concerning the earthquakes in the Caucasus from 1667 to 1670 are eliminated. The basic parameters of the earthquake are determined from equations of a macroseismic field, and include $M=8\pm0.2$ and $I_0\simeq10$. The probable tectonic position of the focus is also examined. The consequences of these conclusions are outlined for dividing the region into seismic districts and for estimating the potential seismic danger. (56 refs.)

121140 Strong earthquakes in the Eastern Caucasus: interpretation of historical data and analysis of geological situation. B.A.Borisov (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.726-37 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
A.A. Nikonov's proposition that an earthquake of unprecedented force ($M\geq8$) took place in the eastern Caucasus on January 14, 1668, is discussed, and its historical and seismogeological basis is proved to be insufficient. The conditions for the occurrence of earthquakes in the Shemakha region are examined. The seismogeological situation in the Sheki-Kutkashen area where, according to Nikov's constructions, the focus of the 1668 earthquake should have been located, is analyzed. Theoretical considerations concerning the principal geological preconditions for the appearance of strong earthquakes in an alpine folded region are advanced. Based on a comparison of historical, seismological, and geological data, it is concluded that the maximum magnitude of earthquakes in the eastern Caucasus cannot be substantially greater than 6.5. (19 refs.)

121141 Possible seismic reflections from the downgoing Pacific plate, 275 kilometers arcward from the Eastern Aleutian Trench. M.A.Fisher, R.von Huene, G.L.Smith, T.R.Bruns (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B7, p.5835-49 (10 July 1983).
Multichannel seismic reflection data collected near the southern Kenai Peninsula, Alaska, show deep events that could stem either from a linear diffractor or from a curved reflector. Whichever is the cause, it must be at a minimum depth of 12 km. If a linear diffractor causes the most obvious events, it strikes at a 60° angle across the surface trend of Mesozoic rocks. Thus the diffractor could be associated with a transverse tectonic boundary that, on the basis of other evidence, is thought to strike through the area of this study. Alternatively, these deep events could be reflections from rocks associated either with a detached piece of oceanic crust or with the downgoing Pacific plate. (41 refs.)

121142 Shear wave polarization anisotropy in the upper mantle beneath Honshu, Japan. M.Ando (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA), Y.Ishikawa, F.Yamazaki.
J. Geophys. Res. (USA), vol.88, no.B7, p.5850-64 (10 July 1983).
Shear wave polarization anisotropy in the wedge portion of the upper mantle between a subducting plate and the Earth's surface is investigated using three-component seismograms of intermediate depth and deep earthquakes recorded at 14 local stations in Honshu, Japan. The horizontal extent of the anisotropic area in the north is 50 km at depths of 50 to 150 km, perhaps prevalent in west Honshu. However, the depth of anisotropic material is not well constrained because of insufficient coverage of seismic ray paths and angles. The crack anisotropy and divine alignment in the mantle can explain the observations. (66 refs.)

121143 Seismic imaging of the Elberton granite, Inner Piedmont, Georgia, using COCORP southern Appalachian data. D.M.Jurdy (Dept. of Geological Sci., Northwestern Univ., Evanston, IL, USA), R.A.Phinney.
J. Geophys. Res. (USA), vol.88, no.B7, p.5865-73 (10 July 1983).
Seismic imaging of the Elberton granite in the Georgia Inner Piedmont was undertaken to define its shape and to determine its relation to the southern Appalachian thrust. The recent Consortium for Continental Reflection Profiling (COCORP) lines in the southern Appalachians suggest a major thrusting of a crystalline block over sediments, although the extent of this thrust is subject to interpretation. The fine-grained Elberton, of Late Devonian age, is the only major pluton crossed by the seismic traverse and is not well defined on the unmigrated common depth point (CDP) seismic sections. Migration by beam-forming reveals more detail. The identification of the granite base, along with the presence of the thrust-related reflectors beneath the pluton, suggests a prethrust or synthrust emplacement of the granite. However, tectonic interpretations of the Inner Piedmont based on the Elberton granite are severely limited by assumptions: that the pluton age corresponds to time of cooling, that the pluton is not fed by a narrow (seismically elusive) feeder, and that the thrust has not been reactivated after emplacement of the intrusive body. If all these assumptions hold, then the Late-Devonian age of the granite is the earliest possible time of thrusting. (24 refs.)

121144 Crustal and upper mantle structure of the northern and central Sierra Nevada. B.B.Mavko (US Geological Survey, Menlo Park, CA, USA), G.A.Thompson.
J. Geophys. Res. (USA), vol.88, no.B7, p.5874-92 (10 July 1983).
Teleseismic data were recorded within the Sierra Nevada to look for lateral variations in the upper mantle. After correcting the P residual data for crustal and topographic effects, there is still a variation of as much as 0.5-0.6 s from the north end of the Sierra Nevada to Mono Lake, located east of the central part of the range. In addition, there are significant variations in travel time patterns, depending on the azimuth of wave arrivals. Two simple modeling approaches have been used to infer the upper mantle velocity structure for the observed variations in travel time. (53 refs.)

121145 Nonlinear strain buildup and the earthquake cycle on the San Andreas fault. W.Thatcher (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B7, p.5893-902 (10 July 1983).
Two contrasting models of the earthquake deformation cycle on strike slip faults predict signifidant temporal declines in shear strain rate near the fault, accompanied by a progressive broadening of the zone of deformation adjacent to it. In the thin lithosphere model, transient deformation results from flow in the asthenosphere due to stress relaxation following faulting through most or all of the lithosphere. For an Earth model with a thick elastic lithosphere (plate thickness$\gg$depth of seismic slip), transient motions are due to postearthquake aseismic slip below the coseismic fault plane. Data from the San Andreas fault indicate a long-term temporal decrease in strain rate that persists for at least 30 years and may extend throughout the entire earthquake cycle. Observations support a cycle-long rate decrease and a temporal spreading of the deformation profile only if movement cycles on the northern and southern locked sections of the fault are basically similar. If so, the usually lower strain rates and broader deformation zone currently observed in the southern San Andreas represent a later evolutionary stage of the northern locked section, where the great earthquake is a more recent occurrence. No sufficiently strong constraints exist to decide between the thin and thick lithosphere models. (40 refs.)

121146 Age dependence of oceanic intraplate seismicity and implications for lithospheric evolution. D.A.Wiens, S.Stein (Dept. of Geological Sci., Northwestern Univ., Evanston, IL, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6455-68 (10 Aug. 1983).
The depths for 16 oceanic intraplate earthquakes have been determined using body wave modeling. A data set composed of these and 11 other well-constrained depths shows that the maximum depth of seismicity deepens with increasing lithospheric age and appears to be bounded by a 700°-800°C isotherm. The maximum depth to which intraplate earthquakes occur is approximately equal to the flexural elastic thickness but much less than the siesmic thickness from surface wave dispersion. The maximum faulting depth is consistent with the predictions of rapid weakening at high temperatures for dry olivine rheologies determined by experimental rock mechanics. Both the number of earthquakes and the cumulative siesmic moment decrease with lithospheric age. (88 refs.)

121147 A method for modeling reflection data from media with lateral velocity changes. J.A.Carter, L.N.Frazer (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6469-76 (10 Aug. 1983).
A new method of modeling zero offset reflection data accommodates both vertical and lateral velocity variations and allows continuous changes in reflectivity throughout the section. Each point in the subsurface is considered a point scatterer, and the energy at each point is distributed over the diffraction curve that would be observed if it were the only scatterer in the subsurface. When the velocity varies only with depth, the diffraction curves are relatively simple to determine. Computing the diffraction curves when there are lateral velocity variations, however, requires extensive ray tracing. The authors' method avoids the extensive ray trace by approximating the exact diffraction curves with perturbed diffraction curves computed for a model in which the velocity varies only with depth. The slowness (reciprocal velocity) function is written as the sum of two functions: the first is large and depends only on depth and the other is small and varies both with depth and position along the line. (26 refs.)

121148 The 1979 Homestead Valley earthquake sequence, California: control of aftershocks and postseismic deformation. R.S.Stein, M.Lisowski (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6477-90 (10 Aug. 1983).
The coseismic slip and geometry of the March 15, 1979, Homestead Valley, California, earthquake sequence are well constrained by precise horizontal and vertical geodetic observations and by data from a dense local seismic network. These observations indicate 0.52 ± 0.10 m of right-lateral slip and 0.17 ± 0.04 m of reverse slip on a buried vertical 6-km-long and 5-km-deep fault and yield a mean static stress drop of 7.2 ± 1.3 MPa. The largest shock had $M_s=5.6$. Observations of the ground rupture revealed up to 0.1 m of right-lateral slip on two mapped faults that are subparallel to the modeled seismic slip plane. In the 1.9 years since the earthquakes, geodetic network displacements indicate that an additional 60 ± 10 mm of postseismic creep took place. The rate of shear strain was anomalously high compared to its preearthquake value and cannot be explained by postseismic slip on the seismic fault but rather indicates that broadscale release of strain followed the earthquake sequence. (27 refs.)

121149 The influence of shear modulus and damping ratio on amplification spectrum and response spectra. G.Marmureanu, D.Bratosin, Fl.St.Balan, E.Cojocaru (Center of Earth Phys. & Seismology, Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.175-84 (March-April 1983). [received: Sept. 1983]
Summarizes the results obtained by the authors regarding the influence of shear modulus and damping ratio on site amplification spectrum and response spectra. The authors pointed out there is a strong nonlinear dependence of shear modulus and damping ratio with dynamic shear strain. All tests were performed on undisturbed specimens (of clay, sand and marl), isotropically consolidated so as to correspond to the situ mean principal effective stress. The equipment used was the Drnevich Long-tor resonant column apparatus from Center of Earth Physics and Seismology, Bucharest. (4 refs.)

121150 On the methods of spectral characterisation of random nonstationary processes with application to the study of Earth tremors. I. A.Preumont.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.211-23 (March-April 1983). In French. [received: Sept. 1983]
After discussing the need to consider seismic accelerograms as random nonstationary processes some nonstationary spectral characterisations are reviewed from density of instantaneous spectral power as a direct prolongation of the spectral density power idea for a stationary process (by Fourier transform of autocorrelation) but having no physical significance, to Mark's physical spectrum. This latter seems the tool best adapted to describe the repartition of energy in the domain (time frequency). This is the principle of uncertainty linking the resolutions obtainable. Some illustrations linked to the seismic domain are provided. (no refs.) *J.S.*

121151 On the methods of spectral characterisation of random nonstationary processes with application to Earth-tremor studies. II. A.Preumont.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.311-16 (May-June 1983). In French. [received: Sept. 1983]
For pt.I see ibid., vol.28, no.2, p.211-23 (1983). Continues the analysis of part I, from the Fourier transform and leading to the response of a narrow-band filter and of a conventional lightly-damped seismograph to a feebly stationary excitation. (no refs.) *J.S.*

121152 Dilatancy in brittle rocks. C.Radu (Center of Earth Phys. & Seismology, Bucharest-Magurele, Rumania), I.Rugina, G.Winter, V.Winter.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.447-50 (July-Aug. 1983).
Dilatency in brittle rocks was studied by means of the strain-gauge method. Dilatancy appears rather in rocks with higher porosity than in more compact ones, presenting also a higher magnitude for the first case. Earthquake precursors depending on increasing strain may occur more frequently in rocks with higher porosity, allowing for easier investigation. (4 refs.)

121153 On the methods of spectral characterisation of nonstationary random processes with application to the study of earth tremors. III. A.Preumont (Belgonucleaire SA, Bruxelles, Belgium).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.367-85 (July-Aug. 1983). In French.
Reviews Mark's (1970) concept of the physical spectrum as probably the best tool for obtaining a decomposition of the total energy of any such process in the time and frequency domain. Time frequency duality is discussed, and its connections with the response of a battery of narrow band-pass filters and with the instantaneous power spectral density are worked out from integral equations. Examples of use in the seismic study of structures are illustrated by an acelerogram with comptuer printouts of its physical spectrum, and graphs of the evolution of the integral for three nominal durations of the Gaussian window and two samples of the excitation process. (26 refs.) *M.B.D.*

121154 Method and results of determining the absorption of seismic waves in the central part of the Baikal Rift Zone. A.A.Dergachev (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.83-90 (1982). Translation of: *Geol. & Geofiz. (USSR),* vol.23, no.6, p.94-101 (1982). [received: Oct. 1983]
A new method is proposed for determining the seismic Q, the basis of which is the central frequency of the seismic wave spectra. The method is applied to seismological observations in the Baikal Rift Zone and data are obtained on the spatial variations of the parameter Q: the upper parts of negative morpho structures of the Earth's crust (rift valleys) have a low Q value, whereas positive morpho structures have a high value; a high-Q layer was detected in the crustal section at a depth fo 15-20 km. (19 refs.)

121155 Interpretation of data of multiple systems of observations of refracted waves when studying the basement of the West Siberian Platform. V.D..Suvorov, V.N.Sergeev (Geology & Geophys. Inst., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.91-7 (1982). Translation of: *Geol. & Geofiz. (USSR),* vol.23, no.6, p.102-9 (1982). [received: Oct. 1983]
A method is proposed for analyzing the processing refracted wave data obtained from multiple observation systems based on transformation of the observed travel-time curves into a time section t_0 and distribution of boundary velocities. The method permits solving the problem of separating waves in the first arrivals. If necessary, the depth section is refined by the method of conjugate points determined by successive approximations. The standard procedure of the operations permits processing the greater part of the data on a computer. (10 refs.)

121156 The dendrochronological dating of seismogenic ruptures in the Stanovoi highland. V.V.Ruzhich, V.A.San'kov, Yu.I.Dneprovskii (Inst. for Study of the Earth's Crust, Acad. of Sci., Irkutsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.57-63 (1982). Translation of: *Geol. & Geofiz. (USSR),* vol.23, no.8, p.62-9 (1982). [received: Oct. 1983]
The use of improved methods of dendrochronology in dating seismogenic structures formed in the historical past or at the present time in the Stanovoi highland has yielded important information on the space and time aspects of the local seismic region. The method described proved to be highly successful in the pleistoseismic zone of the catastrophic Muya earthquake of 1957, and has been useful in obtaining information on other older seismogenic structures in the northeast of the Baikal rift zone. The potential for a wider application of the dendrochronological method in seismotectonics is considered. (12 refs.)

121157 Calculation of the scalar wave field scattered by a sphere and an analysis of the images. V.G.Khaidukov (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.96-104 (1982). Translation of: *Geol. & Geofiz. (USSR),* vol.23, no.8, p.104-14 (1982). [received: Oct. 1983]
A numerical method of the exact solution of the problem of diffraction of an acoustic spherical wave on a spherical inhomogeneity is examined. The possibilities of two methods of visualization of the medium based on an inverted continuation of the pulsed and stationary fields are examined for the sample of the solution of this problem. (11 refs.)

121158 Improvement and testing of a variant of the seismoholographic Kirchhoff transformation. S.A.Vasil'ev, V.V.Perekhvatov (All Union Res. Inst. of Geophys., Moscow, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.128-32 (1982). Translation of: *Geol. & Geofiz. (USSR),* vol.23, no.8, p.139-44 (1982). [received: Oct. 1983]
A regularized algorithm for seismoholographic Kirchhoff transformation of CDP time sections into a dynamic image of the medium is proposed. The regularization method is substantiated and results of testing the algorithm on model and field sections are presented. (8 refs.)

91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

121159 The carbonate-silicate geochemical cycle and its effect on atmospheric carbon dioxide over the past 100 million years. R.A.Berner (Dept. of Geology & Geophys., Yale Univ., New Haven, CT, USA), A.C.Lasaga, R.M.Garrels.
Am. J. Sci. (USA), vol.283, no.7, p.641-83 (Sept. 1983).
A computer model has been constructed that considers the effects on the CO_2 concentration in the atmosphere of continental weathering, biogenic precipitation of $CaCO_3$, seawater-volcanic rock reactions, and the metamorphic-magmatic decarbonation of calcite and dolomite. Rate expressions are derived for all the transfer reactions. These expressions are constructed so as to reflect changes over the past 100 Myr in the rate-controlling parameters. It is found that the atmospehric CO_2 concentration is very sensitive to changes in the seafloor spreading rate and the continental land area. The results indicate, therefore, that plate tectonics largely governs atmospheric CO_2 concentrations and, thereby, the climate of the Earth. (63 refs.)

121160 Shear wave observations in the region north of the San Francisco Bay. A.R.Levander, H.Quin, R.L.Kovach (Dept. of Geophys., Stanford Univ., Stanford, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1031-9 (Aug. 1983).
Examines local earthquake shear wave travel times from a four-station, intermediate-period, three-component seismograph array located in the Coast Ranges north of San Francisco Bay. The preferred interpretation of the data indicates an upper crustal layer with a shear velocity of 3.05 ± 0.10 km/sec over a lower crustal layer having a shear velocity of 3.87 ± 0.15 km/sec. The authors estimate the thickness of the upper crustal layer to be 13.0 ± 3.0 km. The shear velocity of the lower crustal layer, 3.87 km/sec, is higher than crustal shear velocities reported elsewhere in the Coast Ranges and corresponds to the shear velocity of layer three of the oceanic crust. (24 refs.)

121161 The geology and structural history of the Cape Ray Fault Zone in southwestern Newfoundland. D.H.C.Wilton (Dept. of Earth Sci., Memorial Univ. of Newfoundland, St. John's, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.7, p.1119-33 (July 1983).
Structural studies within the Cape Ray Fault Zone indicate that three tectonic events (D1 to D3) have deformed all regional lithologic units. These lithologies are distributed as a tonalitic terrain (intrusive into ophiolitic remnants) to the northwest, a central volcanic-sedimentary terrain, and a staurolite-kyanite gneiss terrain to the southeast. D1 produced the dominant northeasterly striking planar fabrics in the host rocks that are axial planar to isoclinal folds. The fold axes parallel a synkinematic mineral elongation lineation. D2 formed open asymmetrical folds with curvilinear fold axes and local crenulation cleavage. The D3 event produced local conjugate kink folds. Radiometric dates on deformed plutons indicate these deformational events were post-369 ± 12 Ma (post-Middle Devonian) and pre-352 ± 6 Ma (pre-Late Carboniferous). The present work indicates that the deformational events that produced the fault zone overprinted all regional lithologies in a similar manner and that the delineating mylonites were the products of ductile simple shear due to intense localized deformation. (27 refs.)

121162 Bimodal volcanism in Archean greenstone belts exemplified by greywacke composition, Lake Superior Park, Ontario. L.D.Ayres (Dept. of Earth Sci., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.7, p.1168-95 (July 1983).
In the Archean Gamitagama Lake greenstone belt, a metagreywacke-metasilstone formation at least 3.6 km thick largely had an easily eroded, unconsolidated, subaerial, pyroclastic felsic volcanic provenance. The remains of this provenance are now represented by a 0-600 m thick felsic formation sandwiched between mafic flow formations in an adjacent and laterally equivalent 4.5 km thick metavolcanic sequence. The felsic formation includes flows plus various pyroelastic units including crystal-rich ash-flow tuff. Volcanism, erosion, transportation, and sedimentation appear to have been essentially contemporaneous with subaerially erupted ash that was being trans-

ported rapidly by rivers to the sedimentary basin where it was deposited in a submarine fan. (97 refs.)

121163 Rb-Sr and U-Pb dating of bentonites. H.Baadsgaard, J.F.Lerbekmo (Dept. of Geology, Univ. of Alberta, Edmonton, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1282-90 (Aug. 1983).
The authors describe measurements of a 15 cm bentonite in the Z coal (Cretaceous-Tertiary boundary) in E Montana, and of the Ordovician Kinnekulle A_1 bentonite of SW Sweden. U-Pb analyses of zircons from the Z coal bentonite yielded an age of 63.9 Myr from a concordia diagram. Biotite fractions from both bentonites were analysed for Rb-Sr dating. The analyses showed a departure from a linear isochron, when more than about 30% of the original Rb had been lost, but biotites that retained more than 70% of their original Rb gave usable Rb-Sr data. The ages and initial $^{87}Sr/^{86}Sr$ ratios of the Z coal and Kinnekulle A_1 bentonites were 63.7 Myr and 0.7061, and 447 Myr and 0.7094, respectively. (20 refs.)

121164 Continental hypsography. C.G.A.Harrison, K.J.Miskell, G.W.Brass, E.S.Saltzman, J.L.Sloan,II. (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Coral Gables, FL, USA).
Tectonics (USA), vol.2, no.4, p.357-77 (Aug. 1983).
Average continental elevations for 1-degree-square areas have been used to construct detailed continental hypsographic curves. Data are given for each 0.1 km interval of elevation. The availability of the data on tapes allowed calculations of the average elevation of each continent, an important normalizing parameter when comparing continental hypsographic curves, and enabled the effects of the continental shelves to be added on. It has also allowed recalculation of the amount of continent antipodal to continent and production of a map of the world showing these areas. The detailed curves and the amounts of continental flooding during the Neozoic have been used to derive records of sea level variation necessary to explain the amount of flooding for each continent through time. (28 refs.)

121165 Evaluation of the parameters of a medium in constructing a block model by seismic methods. I.A.Sanina (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.581-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]
By using an assembly of structural functions, a method is investigated (with special reference to data of registration of P-waves from remote earthquakes by short-period instruments of the NORSAR array) for evaluation of those parameters of the medium that are necessary for constructing deterministic models. (10 refs.)

121166 On a model of the upper layers of the Earth's crust. M.A.Sadovskiy, V.A.Denshchikov, V.N.Kondrat'yev, A.N.Romashov, V.M.Chubarov (O.Yu. Schmidt Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.645-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]
A two-layer model of the upper layers of the Earth's Crust is considered, which is based on generally admitted facts concerning the block structure and concerning the presence of excess stresses in these layers. A study is made of the simplest variant of the deformation and destruction of the model. A qualitative comparison is made between the results of the model studies and certain data concerning the behavior of real rock masses. (12 refs.)

121167 Generation of arc basalt magmas and thermal structure of the mantle wedge in subduction zones. Y.Tatsumi (Earthquake Res. Inst., Univ. of Tokyo, Tokyo, Japan), M.Sakuyama, H.Fukuyama, I.Kushiro.
J. Geophys. Res. (USA), vol.88, no.B7, p.5815-25 (10 July 1983).
The chemical compositions of primary magmas of olivine tholeiite (OTB), high-alumina basalt (HAB), and alkali olivine basalt (AOB) are obtained by the olivine maximum fractionation model for Quaternary magnesian basalts from the Northeastern Japan arc. These basalts are assumed to have fractionated only olivine crystals before eruption. The melting phase relations for three primary basalt compositions have been determined under both anhydrous and water-undersaturated conditions. The mineral coexistences for these rock melts is studied at different temperatures. The water content of the magma is considered. Based on these estimates and the experimental results, the AOB, HAB, and OTB magmas are suggested to segregate from the mantle at about 1320°C and at 23, 17, and 11 kbar, respectively. As the temperatures at the segregation of the magmas appear to be too high for a stable mantle geotherm, the mantle diapir is the most probable mechanism for the magma production in a subduction zone. Considering the heat of formation of melt in the diapir, the region with temperatures higher than 1400°C has to be present in the mantle wedge. (71 refs.)

121168 Surface deformation associated with a dipping hydrofracture. P.M.Davis (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B7, p.5826-34 (10 July 1983).
Crustal deformation associated with hydrofracture is modeled by a dipping rectangular dislocation beneath the surface of an elastic half space. The Burger's vector is taken normal to the rectangular surface. Analytical expressions for vertical displacements are obtained from integration of Volterra's equation by using Mindlin's point force solutions for the elastic halfspace. In the limits of O° and 90° dip, the results agree with those obtained by Maruyama (1964) for Poisson's ratio 0.25. Expressions for arbitrary Poisson's ratio are given. For elongate dislocations the displacement field agrees with curves given by Pollard and Holzhausen (1979) for two-dimensional, near surface fractures at various dips. The displacement due to a square dislocation is studied. (34 refs.)

121169 Calculated temperatures in overthrust terrains and possible combinations of heat sources responsible for the Tertiary granites in the Greater Himalaya. P.Molnar (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), Wang-Ping Chen, E.Padovani.
J. Geophys. Res. (USA), vol.88, no.B8, p.6415-29 (10 Aug. 1983).
There are three obvious sources of heat that affect the temperature in a region of thrust faulting: heat supplied from below the lower thrust plate, radiogenic heating within the crust of both the upper and, especially, the lower plates, and frictional heating along the fault. The authors assume that heat is conducted primarily in the vertical direction and that solutions to the one-dimensional, time-dependent heat conduction equation can be used to describe the temperature field in overthrust zones. The effects of these three sources of heating can be isolated from one another, treated separately, and then combined in ratio proportional to various assumed rates of heating provided by each. Calculations for a range of possible combinations of heat sources are then used that may have caused two-mica granites of late Tertiary age in the Greater Himalaya. (53 refs.)

121170 Average regional strain due to slip on numerous faults of different orientations. P.Molnar (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6430-2 (10 Aug. 1983).
If a region is cut by faults with different orientations and if the faults intersect the boundaries of the region of interest, then the average finite (rotational) strain, $\epsilon_{ij}=\partial u_i/\partial X_j$, is given by $\epsilon_{ij}=\Sigma\ M^*_{ij}/\mu V$ where μ is the shear modulus, V is the volume of the region, and $\Sigma\ M^*_{ij}$ represents the sum of asymmetric moment tensors, M^*_{ij}. For each fault, $M^*_{ij}=M_0\hat{u}\hat{n}$, where M_0 is the scalar siesmic moment and $\hat{u}$ and $\hat{n}$ are the unit vectors parallel to the slip vector and perpendicular to the fault plane. This result is applicable when the average regional strain occurs primarily by displacements of essentially rigid blocks that together compose the region of interest and hence when both elastic strains and inelastic strains due to folding and bending are small. (4 refs.)

121171 Rare gases from the undepleted mantle?. D.E.Fisher (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA).
Nature (GB), vol.305, no.5932, p.298-300 (22 Sept. 1983).
If the concept of a depleted/undepleted mantle system is valid, rare gas isotopic composition and abundances should be different in continental and plume areas fed from the undepleted mantle than in oceanic glasses fed from a depleted mantle. Ultramific inclusions in basalt have been studied in attempts to find examples of undepleted mantle trapped gases. The author has measured ^4He, ^{40}Ar and ^{36}Ar abundances in two Hawaiian ultramific nodules, and finds clear evidence of incomplete retention of mantle gases plus significant atmospheric contamination. Comparison with the previously measured phenocrysts indicates the prevalence of these complications in all such ultramafic samples. (15 refs.)

121172 Metamorphic and tectonic evolution of granulites, Arunta Block, central Australia. R.G.Warren (Bur. of Mineral Resources, Geology & Geophys., Canberra, Australia).
Nature (GB), vol.305, no.5932, p.300-3 (22 Sept. 1983).
Petrographical and chemical evidence presented indicate a prolonged metamorphic evolution of the granulite terrain in the northern Strangways Range, Arunta Block, central Australia, beginning with migmatization, followed by dry granulite metamorphism at high temperatures (T) and moderate pressures (P) (estimated at 850-920°C, 8 ± 1 kbar^1). This occurred at ~1800 Myr, very shortly after deposition of the protolith, a bimodal volcanic suite and associated sediments. Granulite metamorphism was followed by isobaric cooling, during which there was an episode of pervasive but partial hydration. A tensional, rift-like regime best describes the geological environment in which the protolith formed, was deeply buried, metamorphosed with high heat flow, and then remained in isostatic equilibrium. (26 refs.)

121173 The Mesozoic marginal basin of central Peru. M.P.Atherton, W.S.Pitcher, V.Warden (Jane Herdman Labs. of Geology, Univ. of Liverpool, Liverpool, England).
Nature (GB), vol.305, no.5932, p.303-6 (22 Sept. 1983).
The west Peruvian Trough extends some 1300 km from north of Trujillo to about 150 km short of Arequipa. It received upwards of 9000 m of material during the Mesozoic and within the Cretaceous rocks there is a well defined west-to-east facies change whereby thick, volcaniclastic turbidites and pillow lavas thin eastward to be replaced by a mixed clastic shelf sequence (the 'miogeosyncline'). The authors report chemical analyses of the volcanic rocks and data on the association of cherts, volcaniclastic turbidites, dyke and sill complexes and large gabbro masses as well as geophysical evidence which suggests that the 'eugeosyncline' is an extensional marginal basin similar to that seen in rocks of the same age in Southern Chile. (33 refs.)

121174 Effect of pressure on rare earth element partition coefficients in common magmas. T.H.Green, N.J.Pearson (School of Earth Sci., Macquarie Univ., North Ryde, New South Wales, Australia).
Nature (GB), vol.305, no.5933, p.414-16 (29 Sept. 1983).
Describes a series of experiments in which the role of pressure was isolated from that of temperature and melt composition (or melt structure). The authors are also able to demonstrate a systematic increase in La, Sm, Ho and Lu partition coefficients for sphene/silicate liquid and clinopyroxene/silicate liquid as pressure increases from 7.5 to 30 kbar. (19 refs.)

121175 Seismological evidence for shallow crystalline basement in the Southern Uplands of Scotland. J.Hall, D.W.Powell (Dept. of Geology, Univ. of Glasgow, Glasgow, Scotland), M.R.Warner, Z.H.M.El-Isa, O.Adesanya, B.J.Bluck.
Nature (GB), vol.305, no.5933, p.418-20 (29 Sept. 1983).
New evidence is presented, and old data reappraised, to indicate that the Southern Uplands of Scotland contain crystalline rocks of continental affinity at shallow depth (1-5 km) in at least two zones roughly parallel to the Caledonoid strike. This is in contrast with earlier interpretations (especially of the LISPB) which suggested that the lack of such rocks implied a major discontinuity across the Caledonides near the Southern Uplands Fault. The new interpretations suggest that basement indistinguishable seismologically from that below the Midland Valley continues 15-20 km southwards below the Southern Uplands, and that another such crustal block underlies the Eskdalemuir seismological array further to the south. The existence of such blocks radically affects plate tectonic reconstructions of the Caledonides especially the margins of the Iapetus Ocean. Only drilling is likely to show whether the contact between basement and the overlying Lower Palaeozoic greywackes and shales is structural, igneous or, least likely, simple overstep. (21 refs.)

121176 Lithospheric stretching and North Sea Jurassic clastic sourcelands. M.R.Leeder (Dept. of Earth Sci., Univ. of Leeds, Leeds, England).
Nature (GB), vol.305, no.5934, p.510-14 (6 Oct. 1983).
Uniform lithospheric stretching cannot explain three important aspects of North Sea basin evolution: namely (1) the rapid growth of Middle Jurassic uplands from which were liberated major fluvial-deltaic clastic wedges now forming the main hydrocarbon reservoirs; (2) the occurrence of basin centre upwarp and basaltic volcanism; and (3), widespread and significant (~1 km) subsidence outside the area of demonstrable crustal thinning. The author presents the suggestion that a combination of nonuniform stretching and lithospheric flexuring accounts for these 'fine-tuning' effects of the uniform stretching model with magnitudes close to those demanded by independent geological evidence. (29 refs.)

121177 Confirmation of the Carolina slate belt as an exotic terrane. D.T.Secor,Jr., S.L.Samson, A.W.Snoke (Dept. of Geology, Univ. of South Carolina, Columbia, SC, USA), A.R.Palmer.
Science (USA), vol.221, no.4611, p.649-51 (12 Aug. 1983).
An assemblage of Middle Cambrian Atlantic faunal province trilobites has been found in the rocks of the Carolina slate belt near Batesburg, South Carolina. Geologic and paleomagnetic data suggest that the Carolina slate belt and the adacent Charlotte belt constitute an exotic terrane that was accreted to North America in early to middle Paleozoic time. (25 refs.)

121178 Strength of the Earth's crust and seismic efficiency of earthquake foci. N.D.Zhalkovskii (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.105-12 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.114-22 (1982). [received: Oct. 1983]
The relationships between the seismic moment and the magnitude, energy, fault dimensions, and certain other parameters of the earthquake focus are refined on the basis of the literature data. It is shown that the ratio of the seismic energy to the seismic moment does not depend on the power of the earthquake and amounts to about 10^{-2}. The apparent stress and stress drop on the fault are also independent of the power of the earthquake and are characterized on average by values of 3×10^3 and 8 bars, respectively. These results lead to the conclusion that the strength of the Earth's crust should be at least 3×10^3 bars and the seismic efficiency of the earthquake focus at least 0.5. (52 refs.)

121179 Characteristics of the relation between density and longitudinal and transverse wave velocities in rocks. A.L.Aleinikov, A.M.Tiunova, N.I.Khalevin (Inst. of Geophys., Acad. of Sci., Sverdlovsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.123-7 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.134-9 (1982). [received: Oct. 1983]
The relation between density and longitudinal and transverse wave velocities is analyzed. It is shown that their combined use greatly increases the accuracy of determining the density of rocks in the Earth's crust. (14 refs.)

91.40 VOLCANOLOGY

121180 Geometry of magma bodies beneath Long Valley, California determined from anomalous earthquake signals. C.O.Sanders, F.Ryall (Seismological Lab., Univ. of Nevada, Reno, NV, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.690-2 (1983).
One hundred and ninety-two small earthquakes which occurred recently near the southern edge of Long Valley caldera at depths from 1 to 13 km are used to map the subsurface geometry of magma bodies in the caldera. Seismograms of these events recorded northwest, north, northeast, and east of Long Valley with ray paths through the caldera are often anomalous in that S-wave arrivals are absent and high frequency P-wave energy is missing. These anomalous ray paths intersect in an area of the south-central caldera which are interpreted to be a region of molten or partially molten rock. This magma body lies between about $4^1/_2$ and at least 13 km depth and is 10 km long by 5 km wide beneath 7 km. (8 refs.)

121181 Determination of timing of volcanic events by secular variation and thermal modeling. K.P.Furlong, P.N.Shive (Dept. of Geology & Geophys., Univ. of Wyoming, Laramie, WY, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.701-4 (1983).
The length of time between emplacement of successive lava flows is difficult to determine with high resolution except in regions of very recent or current activity. In paleomagnetic studied, a tacit assumption of the relative timing is made by considering the effects of secular variation to be averaged in samples from a series of flows, a condition which may not in fact be met. Through the combined use of numerical modeling of the cooling history of sequences of lava flows and detailed measurements of the magnetization directions from field samples, constraints can be replaced on the length of time between flows. As individual flow units in a sequence cool, the position within each flow of the last point to pass through the blocking temperature is a function of the relative timing of the flows in the sequence. Additionally, the depth into an underlying flow to which magnetic directions are reset is also a function of this relative timing. (23 refs.)

121182 Volcanic eruptions in the Mediterranean before AD 630 from written and archaeological sources. R.B.Stothers, M.R.Rampino (Goddard Inst. for Space Studies, NASA, New York, NY, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6357-71 (10 Aug. 1983).
Written and archaeological sources from the Mediterranean region have been exhaustively searched for evidence of historical volcanism before the year AD 630. Volcanic eruptions are identified by two methods: direct observations, which give information about Mediterranean volcanoes, and indirect, atmospheric observations, which give at least the dates of very explosive eruptions have occurred somewhere in the northern hemisphere. Seven or more very large explosive eruptions have been detected by these methods. Direct observations indicate great eruptions of Thera, Etna and Vesuvius. Indirect observations imply great eruptions of northern hemisphere volcanoes in the years 217 BC, 44 BC, AD 472, AD 536 and AD 626. Atmospheric veiling and cooling were quite marked for about a year after the eruptions of 44 BC, AD 472, AD 536, and AD 626. (90 refs.)

121183 Effects of melt density on magma mixing in calc-alkaline series lavas. T.L.Grove, M.B.Baker (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
Nature (GB), vol.305, no.5933, p.416-18 (29 Sept. 1983).
Discusses the melt density variations expected to occur during differentiation in calc-alkaline magma systems, and shows how these density changes can influence the generation and chemical composition of mixed magmas. It is assumed that fractional crystallization of basaltic melt is the dominant process in generating the association high alumina basalt, basaltic andesite, andesite, dacite and rhyolite. Liquid density variations may explain the origin of the mixed basaltic andesites and andesites at Medicine Lake. (21 refs.)

121184 Scanning electron microscopic examination of pyroclastic materials: basic considerations. M.F.Sheridan, J.R.Marshall (Dept. of Geology, Arizona State Univ., Tempe, AZ, USA).
Scanning Electron Microsc. (USA), pt.1, p.113-18 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
There is no generally accepted methodology for the examination of pyroclastic particles with the scanning electron microscope (SEM). The present work has revealed the urgent need for a careful and thorough approach to be established. An examination of more than 2000 grains from volcanic deposits led to the finding that an extremely large array of surface textures can be present in the deposits of one eruption. Each particle reveals a different aspect of the deposit's history depending on its size and type. The complexity of pyroclastic material demands consideration of field relationships, grain-size populations and grain types selected for study, sample preparation, the statistical validity of the sample size, and SEM techniques of examination and analysis. There is no short route to characterizing a pyroclastic deposit. (12 refs.)

121185 The dynamics of the melting of lithosphere rocks and the lateral inhomogeneities of the magmatism of island arcs. V.N.Sharapov, V.G.Melamed (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.27-34 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.6, p.33-40 (1982). [received: Oct. 1983]
Considers the dynamics of the melting of lithosphere rocks in the region of a seismic focal zone. The known data on the lateral variations of the magmatism of island arcs are discussed in this light. (68 refs.)

91.45 PHYSICS OF PLATE TECTONICS

121186 Dynamic stress drops of moderate earthquakes of the Eastern Aleutians and their relation to a great earthquake. J.Mori (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1077-97 (Aug. 1983).
Short-period WWSSN records are used to calculate dynamic stress drops of moderate earthquakes (m_b=5.5 to 6.1) in the Eastern Aleutians, Alaska. For short-period pulses where scattering effects often distort the pulse shape, estimates of dynamic stress drop using the formula of Boatwright (1980) have fewer sources of uncertainty than does the formula for static stress drop given by Brune (1970, 1971). Earthquakes of several tectonic settings within the subduction zone are studied: shallow (5 to 8 km) normal faulting events near the trench; earthquakes in the main thrust zone (30- to 50-km depth), and intermediate-depth (100 to 200 km) earthquakes in the Benioff zone. (24 refs.)

121187 Geodetic measurements of postseismic crustal deformation following the 1979 Imperial Valley earthquake, California. J.Langbein, A.McGarr, M.J.S.Johnston, P.W.Harsh (US Geological Survey Office of Earthquakes, Menlo Park, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1203-24 (Aug. 1983).
A geodetic trilateration network comprising 54 baselines was established around the northern part of the imperial fault beginning 12 days after the Imperial Valley earthquake of 15 October 1979, and the line lengths were repeatedly observed during the following 110 days. During the observational period, there was an average of about 10 cm of dextral postseismic fault slip. Geodetic data in conjunction with alignment-array measurements indicate that the postseismic slip U at time t following the main shock is well described by $U(t)=(10.96\pm0.12)$ cm $\log(t/1.75$ days$+1)$, a result that implies that it will be approximately 9 to 10 yr before the rate of postseismic displacement diminishes to the ambient rate of creep of 0.5 cm/a. (23 refs.)

121188 Kinematic history of the Narragansett Basin, Massachusetts, and Rhode Island: constraints on Late Paleozoic plate reconstructions. S.Mosher (Dept. of Geological Sci., Univ. of Texas, Austin, TX, USA).
Tectonics (USA), vol.2, no.4, p.327-44 (Aug. 1983).
The formation of the Narragansett Basin of Rhode Island and Massachusetts and the polyphase deformation geometry of the Pennsylvanian-age basin sediments can be explained by collision and strike slip interactions between an Avalonian microcontinent, the European-North American plate, and the African plate. During the late Paleozoic, sinistral movement between an Avalonian microcontinent and the European-North American plate resulted in formation of pull apart basins. Subsequently, Africa moved toward North America along an east-west trending, dextral megashear zone and collided with the eastern margin of southern North America. The Narragansett Basin is located on the Avalonian microcontinent near the suture with the North American continent and in the transition zone between the megashear and the collision tectonic regimes. The basin shape, stratigraphy, and sedimentary relationships can be explained by the coalescence of two composite grabens which formed at different times. (90 refs.)

121189 Normal faulting, block tilting, and decollement in a stretched crust. J.-P.Brun, P.Choukroune (Centre Armoricain d'Etude Structurale des Socles, Univ. de Rennes, Rennes, France).
Tectonics (USA), vol.2, no.4, p.345-56 (Aug. 1983).
Stretched portions of the crust exhibit complex faulting patterns at upper levels with high-angle and low-angle normal faults. It is difficult to extrapolate surface observations to the crustal scale. Five general models are proposed that combine continuous and discontinuous deformation and geometrical and geological tests are proposed. Two natural examples, the West Armorican Atlantic margin and Eldorado Mountains (Basin and Range Province), are presented. They are characterized by an association of high-angle normal faults, tilted blocks, and low-angle normal faults. Field and geometrical arguments are given to demonstrate that low-angle faults are controlled by decollement surfaces along preexisting interfaces. Geometrical implications of the tilted block pattern are presented and the gravity gliding hypothesis is proposed as a possible explanation of block tilting when associated with low angle normal faults. (47 refs.)

121190 Influence of plate subduction on isostatic compensation in northern California. M.K.McNutt (Dept. of Earth, Atmospheric, & Planetary Sci., MIT, Cambridge, MA, USA).
Tectonics (USA), vol.2, no.4, p.399-415 (Aug. 1983).
The isostatic gravity map for northern California calculated by the US Geological Survey on the assumption of Airy compensation reveals a residual correlation between gravity and topography. Peaks in the Klamath and Siskiyou Mountains west of 122.25°W and north of 40°N are associated with isostatic gravity highs in excess of 100 gu (gravity units), while to the east the Cascade volcanoes Lassen and Shasta display gravity lows less than −300 gu. Admittance calculations which determine the correlation between Bouguer gravity and topography demonstrate that some of the difference in isostatic gravity signature for the Klamaths and Cascades can be attributed to density variations in surficial rock types. Interpretations of response functions and direct modelling indicate that the Klamath Mountains are rootless structures supported by the rigidity of the underlying Gorda plate, while the Cascades are locally compensated by shallower, low-density material within the North American plate. (37 refs.)

121191 The mean life of continents: estimates of continent recycling rates from Nd and Hf isotopic data and implications for mantle structure. D.J.DePaolo (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.705-8 (1983).
An analysis of the initial neodymium and hafnium isotopic compositions of modern and ancient mantle-derived rocks shows that the divergence of the mantle ^{143}Nd/^{144}Nd and ^{176}Hf/^{177}Hf ratios from the chondritic ratios over the past 2 billion years has been much less than would be expected based on the Sm/Nd and Lu/Hf ratios of the mantle source of mid-ocean ridge basalt. The most likely explanation is that rock material from the continents has been recycled semi-continuously back into the mantle over this time period. The required rate of return of continents to the mantle, calculated from a simple transport model, is about 0.35 ± 0.15 of the continental mass per billion years ($\sim$2.5 km^3/year). This result is consistent with the hypothesis that the mass of the continents has been approximately constant since the late Archean, and implies that recycled continental material must be an important component of the upper mantle. (36 refs.)

121192 Mechanism of earthquake foci and stressed state of Iranian plate. T.A.Annaorazova (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8, p.567-71 (1982). [received: Sept. 1983]
The state of stress of the Iranian Plate is investigated on the basis of results of determination of earthquake focal mechanisms. The relative movement of the plate is shown to cause a state of stable uniaxial horizontal compression. The direction of the movement of the Iranian Plate is determined. (8 refs.)

121193 The spatial patterns of the aftershock strain of the focal region of a strong earthquake. O.A.Kuchai (Tashkent Div., Inst. of Earthquake Resistant Construction & Seismology, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.785-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
Following the data of the focal mechanisms of 95 aftershocks (K=12-15) of the Markansu earthquake of Aug. 11, 1974, in the northern Pamirs, the author calculates the values of six components of the strain tensor in the geographic coordinate system. A comparison is made of the components of the strain tensor of the aftershock process and of the components of the strain tensor of the main shock. The focal region of the main event is marked out by the distribution of the values of the components of the strain tensor of the aftershock process, and the dimensions of the rupture of the Markansu earthquake are determined. (13 refs.)

121194 Seismotectonic strain of the crust of the southern part of central Asia. Yu.V.Riznichenko, O.V.Soboleva, O.A.Kuchai, R.S.Mikhailova, O.N.Vasil'yeva (O.Yu. Schmidt Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.809-20 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The results of a calculation and analysis of the components of the strain rate tensor during seismic flow of rock masses of the crust of the Tadzhik depression and orogens of the Pamir and Northern Hindu Kush are presented. The nature of the seismotectonic deformation of the crust is described by the Lode-Nadai coefficient and by the orientation of the lines of maximum shortening and maximum elongation. (38 refs.)

121195 Problems in study of seismotectonic deformation of rock masses. I.L.Nersesov, S.Kh.Negmatullaev, A.A.Lukk, S.L.Yunga (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., Tadzhik SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.821-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
The possibility of studying the seismotectonic deformation in an area of central Asia and Kazakhstan on the basis of determinations of earthquake focal mechanisms is shown. A diagram of the geological-tectonic division of the region is presented and calculation of the parameters of the average mechanisms from published data is given for a number of regions. (33 refs.)

121196 Seismic flow of rock masses in the Caucasus. E.A.Dzhibladze (Inst. of Geophys., Acad. of Sci., Georgian SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.826-31 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
Maps are constructed of the distribution of the components of the rate-of-strain tensor in the seismic flow of rock masses. The parameters of the long-term average seismicity, γ, A, and K_{max}, as well as data on the focal mechanisms of Caucasian earthquakes, served as the initial data. (10 refs.)

121197 Some basic regularities in the seismotectonic deformation of the Kuril-Kamchatka region over 1929-1973. M.A.Danilova, S.L.Yunga (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10, p.832-40 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10 (1982). [received: Sept. 1983]
A study is made of the seismotectonic deformation in the Kuril-Kamchatka seismic zone on the basis of the catalog of the focal mechanisms of strong earthquakes ($M\geq4.5$) over the period from 1929-73, published by World Data Center 'A'. A picture of the spatial distribution of the average mechanisms in the Kuril-Kamchatka region was obtained. (29 refs.)

121198 Early Tertiary subduction zones and hot spots. D.M.Jurdy (Dept. of Geological Sciences, Northwestern Univ., Evanston, IL, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6395-402 (10 Aug. 1983).
The purpose of this paper is to argue that a changing configuration of subduction zones between the early Tertiary and the present has caused the 10° of true polar wander observed in the hot spot framework. First, the evidence that true polar wander has occurred is reviewed. Second, it is argued that the distribution of subduction zones and hot spots control the present maximum axis of inertia. Third, from early Tertiary reconstructions, the position of the maximum axis of inertia will be estimated from surface arrangements for that

time and shown to be in good agreement with the position of the spin axis, as determined from comparison of the paleomagnetic and the hot spot reference frames. Finally, the implications for plate motions are considered for the premise that the inertia tensor of the subducting slabs and hot spots control the location of the spin axis. (38 refs.)

121199 Convection in a two-layer mantle with a strongly temperature-dependent viscosity. P.M.Kenyon, D.L.Turcotte (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6403-14 (10 Aug. 1983).
Recent geochemical and isotopic data support the hypothesis that the Earth's mantle convects in two separate layers with an interface at the 650-km seismic discontinuity. this paper studies the implications of this hypothesis with regard to the thermal boundary layers that are expected to develop adjacent to the interface between the convecting layers. The authors are particularly concerned with a possible decrease in the mantle viscosity across this interface. In order to study the structure of the thermal boundary layers in a fluid with a strongly temperature-dependent viscosity an approximate method developed by Howard (1966) is utilised. If the upper and lower mantle have the same viscosity law, then the stratified convection requires a lower mantle viscosity which is several orders of magnitude lower than the upper mantle viscosity. (68 refs.)

121200 Gloria observations of the propagating rift at 95.5°W on the Cocos-Nazca spreading center. R.C.Searle, R.N.Hey (Scripps Instn. of Oceanography, La Jolla, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6433-47 (10 Aug. 1983).
Presents Gloria long-range sidescan sonar survey of the area around 95.5°W on the Cocos-Nazca Rise, where a propagating rift has been predicted to occur. The sonar images clearly show a wedge of new crust that has been emplaced by propagation into 1-Ma-old crust. The new crust is up to 800 m deeper than the surrounding seafloor, although the elevation difference appears to decay with time. The 'pseudofaults' which bound this new crust have been observed from the rift tip back to crustal isochron 0.65 Ma. Near the rift tip they consist of scarps several hundred metres high with narrow, shallow valleys at their feet. The authors describe the detailed crust structure and tectonics of this area. (23 refs.)

121201 Rotation of the Peruvian Block from palaeomagnetic studies of the Central Andes. K.Heki, Y.Hamano (Geophysical Inst., Univ. of Tokyo, Tokyo, Japan), M.Kono.
Nature (GB), vol.305, no.5934, p.514-16 (6 Oct. 1983).
Palaeomagnetic studies were performed on the rocks of the Central Andes to test the hypothesis of oroclinal bending of the Andes around the Peru-Chile border. Natural remanent magnetization of Mesozoic volcanic and sedimentary rocks of Peru shows a counterclockwise shift of declination by several tens of degrees relative to the field directions of the same ages in the stable south American craton. Two Mesozoic dyke swarms from Arica region (northernmost Chile) also indicate about 20° of declination shift in a counterclockwise sense. These results suggest a considerable amount of counterclockwise rotation of large area north of Arica, that is, oroclinal bending of the Andes around some hinge near the Peru-Chile border. If this declination shift is a result of the wide-area tectonic rotation as suggested by the Mesozoic rocks, oroclinal bending appears to have continued until relatively recent times. (14 refs.)

121202 Vertical movements along the margins of the Atlantic Ocean. I.S.Gramberg, E.M.Litvinov.
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.9-12 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.6, p.12-17 (1982). [received: Oct. 1983]
The geophysical fields on the periphery of the Atlantic Ocean testify to the occurrence of considerable downward vertical movements along the continental margins; these movements have resulted in the formation of separate microcontinents in the abyssal regions of the ocean. (8 refs.)

121203 The Triassic rift system of the Western Siberian plate and its effect on the structure and the oil and gas potential of the Mesozoic-Cenozoic platform mantle. V.S.Surkov, A.A.Trofimuk, O.G.Zhero, A.E.Kontorovich, L.V.Smirnov (Inst. of Geology & Geophys., Acad. of Sci., USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.1-12 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.3-15 (1982). [received: Oct. 1983]
Considers the structure and specific features of development of the Triassic rift system of the Western Siberian plate, and describes the morphological, geologic, and geophysical characteristics of the rift zones. It is shown that the rift system determined the formation of the Mesozoic-Cenozoic sedimentation basin of Western Siberia and the speical type of structures in its sedimentary mantle. This system predetermined the distribution of facies and thicknesses of the sedimentary mantle, and the intensified tectonic activity and thermal regime above the rift zones promoted the formation of oil and gas bodies. (19 refs.)

121204 Tectonic thrust sheets in central Chukotka. I.V.Tibilov (Chaun Geologic Exploration Expedition, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.64-9 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.70-5 (1982). [received: Oct. 1983]
Describes the large thrust sheets and nappes on the eastern coast of Chaun Bay. It is chiefly the sandstone bodies of Triassic age, as well as the Aptian coal measures, that have undergone mass lubricate thrust here. The autochthone is represented by silty-pelitic deposits, and more rarely Triassic flyschoid deposits. The Early Cretaceous (pre-granite) age of the tectonic thrust sheets and nappes is established. The depression of Chaun Bay and the Chaun lowland is evidently confined to the zone of a very large displacement in the Late Mesozoic, to the development of which the formation of the large tectonic nappes and thrust sheets was directly related. (3 refs.)

121205 A tectonophysical analysis of fracturing on the example of the Valkumei tin-ore field (Chukotka Peninsula). I.S.Boikov (Central Res. Inst. of Tin, Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.70-5 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.75-80 (1982). [received: Oct. 1983]
The specific features of the development of fracturing in the ore-forming stage are considered in detail; this stage is divided into a series of phases of rupturing, each preceding a corresponding phase of hydrothermal mineralization. It is shown that the rupture systems of each phase are complex formations, and that the fractures of which they are composed belong to different morphological types: strike-slips, combined strike-slip and reverse or normal faults, and reverse faults. The tectonic stress fields under the conditions of which the fracturing took place are reconstructured for each of these phases. (7 refs.)

91.50 MARINE GEOLOGY AND GEOPHYSICS

121206 A statistical study of the cliff top slumps in part of the Christchurch Bay coastal cliffs. M.E.Barton, B.J.Coles, G.R.Tiller (Dept. of Civil Engng., Univ. of Southampton, Southampton, England).
Earth Surf. Processes & Landforms (GB), vol.8, no.5, p.409-22 (Sept.-Oct. 1983).
A distinction is made between slumping and spalling. Slumping involves a compound slide with rotation and translation: the latter along one of the bedding plane sheat surfaces in the Barton beds. Spalling is an isolated failure of the exposed cliff face due to weathering. Where slumping is the dominant mode of cliff top recession, the latter is an incremental process with the increments being equal to the breadth of the slumps. A statistical study is made of the breadth, length and plan area of 42 slumps observed over a 2 km stretch of the Christchurch Bay coastal cliffs and significant trends deduced. (9 refs.)

121207 Sedimentary environments and postglacial history of the Fraser Delta and lower Fraser Valley, British Columbia. J.J.Clague (Terrain Sci. Div., Geological Survey of Canada, Vancouver, BC, Canada), J.L.Luternauer, R.J.Hebda.
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1314-26 (Aug. 1983).
The Fraser River delta has been built into the Strait of Georgia in southwestern British Columbia during the Holocene. Present-day sedimentary environments, including foreslope, tidal flat, river channel, floodplain, and bog, also existed earlier during the delta's development. Initial growth of the Fraser Delta was preceded both by deglaciation of the region and by the rapid westward extension of the Fraser River floodplain down a partially submerged, glacially scoured trough east of New Westminster. About 10000 years ago, the Fraser River began to empty directly into the Strait of Georgia through a gap in the Pleistocene uplands at New Westminster. (43 refs.)

121208 Temporal variations of beam attenuation coefficient on the continental rise off Nova Scotia. Hasong Pak, J.R.V.Zaneveld (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4427-32 (20 May 1983). [received: Oct. 1983]
Two separate time series observations of light transmission in the bottom water on the Continental Rise off Nova Scotia show fluctuations of light transmission in a wide range, 0.50% transmission at $\lambda=660$ nm. The range corresponds approximately to SPM concentrations of 12 mg/l to 150 μg/l. Nepheloid layers of significant turbidity, called benthic storms, were observed in 30 and 10% of the time, respectively, for the two observations, and each storm lasted 2-5 days. High frequency fluctuations represented by pulse lengths less than 10 min were observed superimposed on the low frequency fluctuations during 16 and 4% of the time. Both the major storms and the high frequency pulses are interpreted to be a result of resuspension of bottom sediments at varying distances from the instrument. (10 refs.)

121209 A model for shoreline evolution around a river mouth. Ming-Chung Lin (Graduate School of Harbor & Ocean Engng., Nat. Taiwan Coll. of Marine Sci. & Technol., Keelung, Taiwan), Jyh-Cherng Wang.

J. Chin. Inst. Eng. (Taiwan), vol.6, no.3, p.141-51 (July 1983). In Chinese.

Proposes a model for predicting long-term shoreline evolution by incorporating certain river parameters into the Willis beach evolution model. The proposed model is at first applied to four ideal cases to investigate its general characteristics and adaptability, and good results are found. Finally, as an application of the model, a numerical simulation of shoreline changes around the Cho-shui River mouth is performed and compared with field data. Rasonable agreement is found. (18 refs.)

121210 Geochemical evidence of a massive slide in the southern Norwegian Sea. G.J.de Lange (Dept. of Geochem., State Univ. of Utrecht, Utrecht, Netherlands).

Nature (GB), vol.305, no.5933, p.420-2 (29 Sept. 1983).

During the 1981 cruise of the MS Tyro to the southern Norwegian Basin several piston-cores were collected for sedimentological research. Some of these were available for geochemical study. In laboratory analyses the pore water composition of one of these cores showed evidence of input of non-saline water, whereas pore water in other cores from the same basin did not give any indication of dilution with fresh water. Careful examination of the chemical constituents of the pore water and some parameters of the sediment gives convincing evidence for the origin of the fresh water. The presence of non-saline water can be attributed to a massive slide of a coastal fresh-to-brackish sediment 'slab', with preservation of structural and pore water composition. This sliding is thought to have taken place about 12000 to 15000 years BP. (52 refs.)

91.60 PHYSICAL PROPERTIES OF ROCKS AND MINERALS

121211 The solubility of calcite and aragonite in sweater at various salinities, temperatures, and one atmosphere total pressure. A.Mucci (Dept. of Oceanography, Texas A&M Univ., College Station, TX, USA).

Am. J. Sci. (USA), vol.283, no.7, p.780-99 (Sept. 1983).

The stoichiometric solubility constants of calcite and aragonite in seawater were determined over a wide range of salinity (5-44 per mil) and temperature (5°-40°) at 1 atm. total pressure. The measurements were carried out from both supersaturated and undersaturated solutions using a closed system technique. The solutions were equilibrated with carbonate solids for periods ranging from 5 days to almost 2 yrs. This study represents the only long term equilibration investigation of the stoichiometric solubility of aragonite in seawater. (55 refs.)

121212 The α-β transition of quartz; a view of some current problems: order-disorder or displacive transition, thermodynamic behaviour. G.Dolino, J.-P.Bachheimer (Lab. de Spectrometrie Phys., Saint-Martin-d'Heres, France), F.Gervais, F.Wright.

Bull. Mineral. (France), vol.106, no.3, p.267-85 (1983). In French.

This paper presents a review of some recent results. The possibility that the high temperature β phase is disordered has recently been supported by a neutron diffraction structure determination. The Landau theory of first order phase transitions gives a good description of the behaviour of the α phase right up to the α-β transition. However the β phase presents anomalous features which cannot be explained within the framework of this simple theory. The interface between α and β phase is inhomogeneous and gives rise to important light scattering. A soft mode corresponding to rotations of SiO_4 tetrahedra has been observed. The dynamic behaviour of the other vibration modes is also perturbed by the transition. In the β phase, an overdamped soft mode has been measured by neutron scattering, which indicates anharmonic motion in a potential well which may have several minima. A description in terms of dynamic correlated disorder may well be the best model to take account of apparently divergent experimental observations. (103 refs.)

121213 Dissociation of *c* dislocations in sillimanite Al_2SiO_5. A.Lefebvre, J.Paquet (Univ. des Sci et Tech. de Lille, Villeneuve D'Ascq, France).

Bull. Mineral. (France), vol.106, no.3, p.287-92 (1983).

c dissociated dislocations with variable dissociation widths (from 300 Å to a few microns) are systematically found in sillimanite studied by transmission electron microscopy. The corresponding stacking faults (with displacement vector 1/2 [001]) only slightly alter the anionic sublattice of the structure but they modify the order of Al and Si cations among the tetrahedral interstices; the resulting degree of disorder depends on the orientation and the location of the faults in the structure. The observed (*hk* 0) preferred orientations of the faults tend to minimize the disorder, but this disorder should not be ignored as it may have significant effects on phase relations of of the Al_2SiO_5 polymorphs. (17 refs.)

121214 Photoacoustic spectra of natural apatites in the near ultraviolet and visible regions. P.Sladky (Dept. of Chem. Phys., Charles Univ., Prague, Czechoslovakia), Z.Pacl, P.Hegner, R.Rericha.

J. Photoacoust. (USA), vol.1, no.3, p.387-93 (1982-1983). [received: Oct. 1983]

Ten natural apatites from Tunisia, Senegal, USA, Jordon, Morocco, USSR, Spanish Sahara, Egypt, and Algeria were studied by photoacoustic spectroscopy in the 260-760 nm region. The PA spectra obtained from powders (below 0.1 mm, above 150 mesh) are characteristic for the apatites and can be used for their identification. Although no district bands were observed under a relatively low resolution, the integrated intensity or the maximum PA signal can be used as a measure of the 'colouredness' of the sample. The absorption increasing from 760 to 260 nm is due to organic impurities (of the order of 1 wt.%) and minority transition elements, especially Fe (below 1 wt.%). (12 refs.)

121215 Thermal expansion and cracking of three confined, water-saturated igneous rocks to 800°C. S.J.Bauer, J.Handin (Center for Tectonophys., Texas A&M Univ., College Station, TX, USA).

Rock Mech. & Rock Eng. (Austria), vol.16, no.3, p.181-98 (Aug. 1983).

The thermal expansions of water-saturated Charcoal Granite, Mt. Hood Andesite, and Cuerbio Basalt have been measured at effective confining pressures (P_e) of 5, 50, and 100 MPa to 800°C. The mean coefficient of linear thermal expansion is a function of lithology, P_e, temperature and initial porosity (ϕ). The difference between measured values of thermal expansion and those calculated from simple mixture-theory relates to new crack porosity generated as a result of differential thermal expansion at the anisotropic grain scale. For the granite, a two to three order of magnitude increase in permeability (k) is predicted from the relation, $k \propto \phi^3$. (44 refs.)

121216 Solubility of corundum in supercritical water. K.H.Becker, L.Cemic, K.E.O.E.Langer (Inst. fur Mineralogie und Kristallographie, Tech. Univ., Berlin, Germany).

Geochim. & Cosmochim. Acta (GB), vol.47, no.9, p.1573-8 (Sept. 1983).

The isothermal (670-700°C) solubility of corundum in supercritical water, within the stability range of corundum as a phase of the system Al_2O_3-H_2O, has been determined by the weight loss method. Experiments were performed in the pressure range 2.5 to 6 kbar and in the pressure range 10 to 20 kbar. All data could be fitted by the linear equation $S[\text{ppm } Al_2O_3] = -12.37 + 7.24.p[\text{kbar}]$ with correlation coefficient $r=0.9963$. (27 refs.)

121217 Precursors of the destruction of a large rock sample. G.A.Sobolev, A.A.Semerchan, B.G.Salov, H.A.Spetzler, C.H.Sondergeld, V.N.Badanov, A.V.Kol'tsov, V.F.Los', R.M.Nasimov, A.V.Ponomarev, I.R.Stakhovskii, V.A.Terent'ev, I.M.Turetskii (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.572-80 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]

The process and precursors of the destruction of a granite sample with a 50000-ton press is investigated. This involved the measurement of strains, acoustic and electromagnetic emissions, propagation velocity and amplitude of elastic waves, electric resistance, and intrinsic electrization. It is established that, before the local internal destruction of sample areas, substantial changes in the spatial distribution of the above quantities are observed which can be classified as destruction precursors. The effects of nonuniformity of the rock on the preparation and development of the destructive process and the magnitude and spatial distribution of the precursors investigated. (8 refs.)

121218 Shock polymorphism of manganese fluoride. V.N.German, A.M.Podurets.

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.587-90 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]

A study is presented on the shock compressibility of manganese fluoride, as well as an X-ray study of samples shock-compressed at pressures up to 80-350 kbar in containers made of steel and aluminum at initial temperatures of 10°C and −150°C. A break is found on the shock adiabatic curve which corresponds to a phase transition at a pressure of about 100 kbar. In compressed samples, phases are found with a rhombohedral structure of the α-PbO_2 and $PbCl_2$ type. Quantitative estimates of the phase composition are presented for the compressed samples. The polymorphism of manganese fluoride under dynamic and static squeezing is compared. (8 refs.)

121219 Evaluation of the magnetic structure of heterophase-altered titanomagnetites (based on oceanic basalts). D.M.Pecherskiy, V.A.Ivanov, L.Ye.Sholpo (Phys. Dept., Vladivostok State Univ., Vladivostok, USSR).

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8, p.607-11 (1982). [received: Sept. 1983]

On the basis of a study of the distribution of magnetic density on a preisach diagram for a series of oceanic basalt samples, it is established that the original homogeneous, multidomain titanomagnetites and products of their decomposition have practically the same magnetic structure. Heterophase-altered titanomagnetites also retain close to the original magnetic structure in a number of cases. The preservation of the magnetic structure during heterophase alteration of titanomagnetites has a great practical significance for paleomagnetic research, since the direction and apparently other properties of the original natural remanent magnetization of the rock must be preserved here. (15 refs.)

121220 Quantitative criteria for single- and multidomain states in ferromagnetic minerals in rocks. V.A.Ivanov, L.Ye.Sholpo (Inst. of Terrestrial Magnetism, Ionosphere, & Radio Wave Propagation, Acad. of Sci., USSR).

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.612-16 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]

On the basis of a comparison of a thermomagnetic criterion for the domain structure with magnetic-density distributions on a Preisach diagram, the characteristic features of these distributions are confirmed for rock samples containing single- or multidomain grains of ferromagnetic minerals. Simple numerical criteria for domain structure are established, calculated on the basis of ideal magnetization, remanent saturation magnetization, and the field disrupting it. (4 refs.)

121221 Magnetism of an ensemble of fine magnetite particles. K.A.Valeyev (Bashkir State Univ., Bashkir, USSR).

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.8, p.617-22 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.8 (1982). [received: Sept. 1983]

Results are presented for a study of the magnetic properties of an ensemble of fine magnetite particles of various sizes. It is established that the magnetic parameters of the magnetite particles less than 35 μm in size depend to a substantial degree upon the methods of obtaining them. As the size of the particles decreases, the oxide surface layer affects the magnetic properties more and more. (22 refs.)

121222 Theory of thermoremanent magnetization in a multidomain grain of inhomogeneous magnetic hardness. V.P.Shcherbakov, G.P.Markov (O.Yu. Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).

Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.9, p.681-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.9 (1982). [received: Sept. 1983]

A theory of the formation of *TRM* in a multidomain grain containing both magnetically hard and magnetically soft sections is developed. Only hysteretic processes were examined, no allowance being made for the influence of thermoactivation effects. The phenomenon of the formation of negative *TRM* in the soft phase providing its blocking temperature $T(B_2)$ is below some critical value, was discovered. The *TRM* value with allowance for the effect of screening by the soft phase of the magnetic moment of the hard sections decreases with increase in the size L of the grain as L^{-1}, where $\gamma=(0.45$-$0.7)$, which is in good agreement with experimental data. The dependence $I_{ri}(H)$ is non-linear; in small fields $i_{rt} \sim H^{\alpha}$, $\alpha<1$, and with increase in the field the nature of the dependence changes and $I_{rt} \sim C_1 + C_2H^{\alpha}$. The problem of the effective demagnetization factor N for multidomain grains is examined in detail. (11 refs.)

121223 On the opening of a crack in rocks. M.Maiti, R.Paramguru (Dept. of Math., Indian Inst. of Technol., Kharagpur, India).
Indian J. Pure & Appl. Math., vol.14, no.9, p.1131-6 (Sept. 1983).
In connection with hydraulic fracture of an oil-bearing stratum, the problem of opening a crack in an infinite space has been discussed in the paper. The equilibrium boundary of the crack surface has been determined basing the analysis on dislocation layers. (5 refs.)

121224 The effects of aqueous chemical environments on crack and hydraulic fracture propagation and morphologies. J.D.Dunning (Dept. of Geology, Indiana Univ., Bloomington, IN, USA), W.L.Huf.
J. Geophys. Res. (USA), vol.88, no.B8, p.6491-9 (10 Aug. 1983).
The role of surface active aqueous environments in chemomechanical weakening of geologic materials is examined in light of the results of hydraulic fracture tests in sandstone, calorimetric studies, and crack propagation tests in synthetic quartz. In hydraulic fracture tests employing Crab Orchard Sandstone it was found that the effective hydraulic fracture pressure was reduced, over that attained with distilled water, when 5×10^{-4} M aqueous solutions of dodecyl trimethyl ammonium bromide (DTAB) were used as the hydraulic fracture medium. The degree of branching of the fractures was also increased in the presence of the DTAB solution. Previously reported crack propagation stress values in quartz exposed to distilled water and various DTAB solutions displayed the same trend. (24 refs.)

121225 Hysteresis in the closure of a nominally flat crack. C.H.Scholz, S.H.Hickman (Dept. of Geological Sci., Columbia Univ., Palisades, NY, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6501-4 (10 Aug. 1983).
It is shown that when two nominally flat rock surfaces are placed together and subjected to a normal load, the resulting closure closely follows a constitutive law predicted by theory. However, the constitutive law exhibits hysteresis. The hysteresis is evidently produced by friction on parts of the surface where the contact is oblique to the load. This behavior, which should be shared by joints and other fractures in the upper part of the crust, suggests that the elastic properties of the near-surface parts of the Earth may be far more complex than previously thought. (11 refs.)

121226 The dependence of magnetic domain structure upon magnetization state with emphasis upon nucleation as a mechanism for pseudo-single-domain behavior. S.Halgedahl, M.Fuller (Dept. of Geological Sci., Univ. of California, Santa Barbara, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6505-22 (10 Aug. 1983).
The stable carriers of the paleomagnetic record in rocks are commonly fine pseudo-single-domain (PSD) particles between about 1 and 20 μm in diameter. However, the underlying mechanism which determines PSD behavior has previously remained in debate. To study this problem, magnetic domain patterns have been observed with the Bitter method on particles of natural pyrrhotite and intermediate titanomagnetite in various magnetization states, including natural remanent magnetization (NRM), after alternating field demagnetization of the NRM and during high-field hysteresis. From these observations it is evident that two primary mechanisms govern high-field hysteresis behavior: (1) 'bulk' pinning of fully developed domain walls by intervening energy barriers, and (2) nucleation, the creation and expansion of walls into the particle volume to produce a fully developed domain structure. These observations demonstrate that nucleation can explain several important aspects of PSD behavior. (53 refs.)

121227 Detrital remanent magnetization in hematite. M.B.Steiner (Dept. of Geology/Geophys., Univ. of Wyoming, Laramie, WY, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6523-39 (10 Aug. 1983).
Heavy mineral placer layers within channel sandstones of the Morrison Formation (western United States) have been shown to contain a very stable, accurate record of the Jurassic geomagnetic field. These laminae are composed almost entirely of hematite grains; in particular, they are largely the hematite pseudomorph of magnetite, martite. The laminae record the correct geomagnetic field direction during a period of rapid apparent polar wander, which suggests an early acquisition of the remanence. Several other remanence characteristics imply that the remanence is probably a detrital remanent magnetization (DRM). (26 refs.)

121228 Progress of thermoluminescence research on geological materials. A.V.Sankaran, K.S.V.Nambi (Bhabha Atomic Res. Centre, Bombay, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.49, no.1, p.18-112 (1983).
When the potential applications of thermoluminescence in the field of geochronology were recognized, detailed basic studies regarding the build up, stability and several other facets of thermoluminescence were taken up. Over the past few decades, many applications of this phenomenon to probe geological problems and processes were attempted. Among these can be mentioned the studies on sediments, stratigraphy, ore-prospecting, palaeoclimates and meteorites. The authors review the observations made regarding thermoluminescence in a number of minerals and also its application in some of the important branches in geology. Pertinent areas in the context of Indian geology are also furnished at the end, along with the methodology in field collection and laboratory practice. (310 refs.)

121229 Rocks behaviour under periodic load. C.Radu (Center of Earth Phys. & Seismology, Bucharest-Magurele, Rumania), I.Rugina, G.Winter, V.Winter.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.201-9 (March-April 1983). [received: Sept. 1983]
The paper is devoted to the study of rock behaviour during compressive uniaxial periodic load under variable stresses. Three periodic loading modes were considered: I. $\sigma_{\min}$ and $\sigma_{\max}$ constant, with a uniform rate of load; II. $\sigma_{\min}$ constant and $\sigma_{\max}$ variable, with an increasing rate of load; III. $\sigma_{\min}$ and $\sigma_{\max}$ variable, with a uniform rate of load. Experimental results showed that the rock microfracturing process is statistically similar to an earthquake generating process. (13 refs.)

121230 Theoretical models of thermo-mechanical ductile shear zone deformation in rocks. J.M.Lockett.
Univ. Keele, England thesis, Sept. 1982
Thermo-mechanical models of ductile shear zones have been constructed for both viscous and viscoelastic materials. The viscous model has been applied to both shear zones and ductile thrusts for constant velocity and constant shear stress boundary conditions. For the constant velocity boundary condition the viscous shear zone model provides an explanation for a number of geological structures.

91.65 GEOPHYSICAL ASPECTS OF GEOLOGY, MINERALOGY AND PETROLOGY

121231 Geometry and kinematics of fault-bend folding. J.Suppe (Dept. of Geolog. & Geophysical Sci., Princeton Univ., Princeton, NJ, USA).
Am. J. Sci. (USA), vol.283, no.7, p.684-721 (Sept. 1983).
It is shown that many map-scale folds in sedimentary sequences are formed by the bending of fault blocks as they ride over non-planar fault surfaces; these structures are designated fault-bend folds. A number of geometric and kinematic properties of parallel fault-bend folds are described, and most important of which is a relationship between fault shape and fold shape for shape bends in faults. These relationships are useful tools for developing internally consistent cross sections in areas of suspected fault-bend folding, particularly in fold-and-thrust belts. (20 refs.)

121232 Kink folds at Upper Manitou Lake, northwestern Ontario. P.I.Wallace, P.M.Clifford (Dept. of Geology, McMaster Univ., Hamilton, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1305-13 (Aug. 1983).
Two sets of conjugate kink folds occur in the greenstones of Upper Manitou Lake, northwestern Ontario. One set is sparsely developed; the later set is developed over the entire area, concentrating in the neighbourhood of the Manitou Straits Fault. This second set of kink folds is asymmetrically developed and seems to be associated with sinistral movement along the fault. The mechanism of fold development involved rotation of kinked foliae between kink fold boundaries, but lateral migration of these boundaries and of the tip of the kink fold is a necessary part of the mechanism. The folds developed at relatively low confining stresses by shear along closely spaced schistosity planes. (20 refs.)

121233 Geophysical approach to the structural interpretation of the Lake Becancour region, Thetford Mines, Quebec. M.K.Seguin (Dept. de Geologie, Univ. Laval, Quebec, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1327-39 (Aug. 1983). In French.
Gravity anomaly (Bouguer and residual) and magnetic maps of the Thetford Mines area are used to explain the mechanism by which the Lac Becancour structural unit was emplaced. The geophysical data suggest that the Lac Becancour structural unit is an old (Early Cambrian or Eocambrian) block that has undergone polyphase deformation during the Taconic Orogeny rather than being a horst-like body emplaced by vertical rise. Identical overthrust slices of Hadrynian basement in the centers of imbricated blocks and nappes of lower Paleozoic rocks are commonly observed in the Caledonides of Norway and Sweden where they generally have the appearance of antiforms or synforms. (40 refs.)

121234 Volatiles in basalts and andesites from the Galapagos Spreading Center, 85° to 86°W. C.D.Byers, D.W.Muenow, M.O.Garcia (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.9, p.1551-8 (Sept. 1983).
Glasses from submarine lavas recovered by the ALVIN submersible from the Galapagos Spreading Center near 86°W have been analyzed by electron microprobe for major elements and by high-temperature mass spectrometry for volatiles. The samples studied range in composition from basalt to andesite and are more evolved than typical MORBs. The H_2O, and F contents of these lavas are substantially higher than any previously reported for MORBs. Reduced carbon gas species, principally CH_4 and CO, were discovered in andesite glasses, perhaps indicating a more reduced oxidation state of the upper mantle than is commonly assumed. (44 refs.)

121235 Forced vibrations and integral equations of a fluid resonator. Applications to the study of fissures in the middle of rocks. J.M.Thillier, G.Fras, P.Jouanna (Lab. de Genie Civil, Univ. de Montpellier II, Montpellier, France).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.185-200 (March-April 1983). In French. [received: Sept. 1983]
An integral equation method is applied to the study of fluid filled cavities in impermeable rock. The compressible fluid is excited by a harmonic source placed down a borehole. The transfer function of the cavity is derived. The pressure variation satisfies the integral equation of the Helmholtz resonator. After discretisation of the boundaries limits are studied for the flow at the entrance of the fissure. The singular integrals are resolved using Bessel and Struve functions. A two-dimensional example is treated that corresponds to a cylindrical fissure of constant thickness inclined to the borehole. Finally, the advantages of this method are given. Comments are made on how to treat a three-dimensional problem. (7 refs.)

121236 Tobermorites: a new family of cation exchangers. S.Komarneni, D.M.Roy (Material Res.Lab., Pennsylvania State Univ., University Park, PA, USA).
Science (USA), vol.221, no.4611, p.647-8 (12 Aug. 1983).
Tobermorites have cation-exchange and selectivity properties intermediate between those of clay minerals and zeolites. Aluminum-substituted tobermorites in particular show high selectivity for cesium. This new group of cation exchangers may find applications in catalysis and in nuclear and hazardous waste disposal. (9 refs.)

121237 The development of the Beret uplift and its conjugate depressions during the Late Precambrian in the northwestern part of the Eastern Sayan region. A.S.Gibsher, A.A.Postnikov (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.35-9 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.6, p.41-6 (1982). [received: Oct. 1983]
Evidence is presented for a complicated paleotectonic structure of the area under study during the Late Precambrian, as opposed to the hitherto prevailing idea of a single Mana depression. The Beret uplift and the conjugate Zherzhul and Ust'-Mana depressions are distinguished, and their geologic history is considered. It is shown that the volcanogenic rocks of the Beret volcanic ridge are replaced by facies of sedimentary deposits in the depressions framing the ridge; this undermines the traditional idea that the three-member structure of the Kuvai series (Upper Riphean) is persistent. (17 refs.)

121238 The morphology of the gabbroid plutons and scale of basic magmatism in the Ol'khon area. M.R.Novoselova, E.Kh.Turutanov (Inst. of Earth's Crust, Acad. of Sci., Irkutsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.6, p.40-6 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.6, p.46-53 (1982). [received: Oct. 1983]
The subsurface morphology and vertical extent of the newly-discovered Krestova, Ozerskii and Kuchelga plutons are determined for the first time; these plutons are confined to a single tectonic zone formed along previously, which reaches the eastern edge of Lake Baikal. (12 refs.)

121239 On the age of the basal strata of the Ordovician to Middle Devonian complex in the northwestern Altai region. N.V.Sennikov, V.D.Ermikov, Z.E.Petrunina, A.A.Puzyrev, L.G.Severgina (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.51-6 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.56-61 (1982). [received: Oct. 1983]
Considers the stratigraphic position and the interrelationships of the Lower and Middle Ordovician rocks in the Northwestern Altai region. The relationships found among these rocks make it possible to date the regional unconformity which represents a reorganization of the regional structure and a change in tectonic regime. (12 refs.)

121240 Some distinctive features of the crustal structure and metallogeny of the southern frame of the Siberian platform. L.A.Sharlovskaya (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR).
Sov. Geol. & Geophys. (USA), vol.23, no.8, p.89-95 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.8, p.95-103 (1982). [received: Oct. 1983]
Interpretation of the geologic and geophysical data reveals extended zones of permeability that are determined by the block structure of the Earth's crust in the area of the Siberian platform's southern frame. The confinement of the alkalic magmatic rock complexes to the zones of permeability, along with their specific metallogenic profile, enables these zones to be identified with the corresponding metallogenic belts, and their reflection in the magnetic field facilitates their mapping. (20 refs.)

121241 Geology of the Moine rocks of the Loch Eil area, West Inverness-shire. R.A.Strachan.
Univ. Keele, England thesis, 1982
Detailed mapping of 120 sq. km has been carried out within the Moine rocks of the Loch Eil area, West Inverness-shire. The metasedimentary rocks of the Loch Eil Division Moine are composed of a series of psammites, quartzites and 'banded' units with minor semipelites. This sequence has been lithologically subdivided into ten lithostratigraphic units. Amphibolite facies metamorphism (M1) accompanied D1: grade was of upper to mid-amphibolite facies in the W of the Loch Eil area and declined eastwards to mid- to low-amphibolite facies. Subsequent metamorphic events (M2-M4) only involved the recrystallisation and local retrogression of M1 assemblages during metamorphism of amphibolite and greenschist facies. The Loch Eil Division lies in tectonic contact with the underlying Glenfinnan Division which, in the Loch Eil area, is composed mainly of migmatitic semi-pelitic gneiss. The Loch Eil Division has been subjected to five phases of deformation (D1-D5). The granitic gneisses and amphibolites of the Loch Eil area are considered to be meta-igneous bodies.

121242 Karst palaeoenvironments. A reconstruction with particular reference to the Morecambe Bay area. S.J.Gale.
Univ. Keele, England thesis, 1981
At least four phases of karst development can be recognised in the Morecambe Bay area of northwest England. It is possible to reconstruct the former pattern of drainage through the now-abandoned caves and to show that the caves probably date from more than one phase of hydrological development. A semi-quantitative picture of the palaeohydrology of certain karst drainage systems in the area is provided. It is also possible to reconstruct the hydraulic conditions under which former flows occurred. The surface topography of the area, previously regarded as largely a response to episodes of planation associated with falling sea levels, is studied. Finally, some of the characteristic surface karst features of the area are described, including large-scale closed depressions.

121243 Stratigraphy, sedimentology and palaeontology of the Lower Carboniferous of Anglesey. Vol.I. J.R.Davies.
Univ. Keele, England thesis, 1982
The Anglesey Dinantian succession is shown to record the establishment and growth of a land-attached carbonate platform. Underlying basement terrain and marginal terrigenoclastic accumulations are demonstrated. Palaeokarstic surfaces record the periodic lowering of sea level and the emergence of extensive areas of the limestone shelf. The sequence of numerous transgressive/regressive minor cycles is constructed.

121244 Mineralogy, petrology and geochemistry of the Serres-Drama granitic complex, northern Greece. S.Theodorikas.
Univ. Keele, England thesis, 1982
The Serres-Drama granitic complex is situated in the Rhodope massif (North Greece). It comprises a broad spectrum of rock-types (gabbro, dioritic xenoliths, monzonite, quartz monzonite, granodiorite, granite, aplite and pegmatite veins). From petrographical, mineralogical, geochemical and field studies, it can be seen that the granitic complex separates distinctly into two groups of rock-types, termed the 'intermediate' group (granite, granodiorite and quartz monzonite) and the 'basic' group (gabbro, dioritic xenoliths and monzonite). Aplites and pegmatites have not been classified in this group. The Serres-Drama granitic complex is a calc-alkaline 'I-type' complex similar to the 'magnetite' series complexes described by Ishihara (1977). Chemical characteristics indicate that it originated in the compressional zone of a mature continental arc system.

91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

121245 Rates of surface processes on slopes, slope retreat and denudation. I.Saunders (Dept. of Geography, Simon Fraser Univ., Burnaby, BC, Canada), A.Young.
Earth Surf. Processes & Landforms (GB), vol.8, no.5, p.473-501 (Sept.-Oct. 1983).
Results taken from 270 publications on rates are summarized, and collated with those from 149 publications reviewed previously (Young, 1969, 1974). The data are classified by major climatic zone, normal or steep relief, and consolidated or unconsolidated rocks. Representative rates and their ranges are given for soil creep, solifluction, surface wash, solution (chemical denudation), rock weathering, slope retreat, cliff (free face) retreat, marine cliff retreat, and denudation, the last being compared with representative rates of uplift. (63 refs.)

121246 Ground failure along the New River caused by the October 1979 Imperial Valley earthquake sequence. T.H.Heaton (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA), J.G.Anderson, P.T.German.
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1161-71 (Aug. 1983).
Recognizes a number of ground failures along the south bank of the New River north of Brawley, California, following the 15 October 1979 Imperial Valley, California, earthquake sequence. The zone includes a large pond and numerous sand boils, apparently caused by liquefaction, near the Del Rio Country Club. These ground failures, together with failures at the New River bridge west of Brawley and at Wiest Lake, form a discontinuous zone 10 km long. While this zone appears to coincide with the aftershocks following the 16 October 1979, M_L 5.8, Brawley earthquake (the largest aftershock of the Imperial Valley earthquake), a cause and effect relationship cannot be demonstrated. No evidence of tectonic surface faulting could be found. (5 refs.)

121247 Haughton impact structure: structural and morphological aspects. P.B.Robertson (Earth Phys. Branch, Dept. of Energy, Mines & Resources, Ottawa, Ontario, Canada), J.F.Sweeney.
Can. J. Earth Sci. (Canada), vol.20, no.7, p.1134-51 (July 1983).
Haughton is a complex meteorite impact structure of Tertiary age on Devon Island in the Canadian Arctic. The 20.5 km diameter site was formed in essentially flat-lying Paleozoic carbonates, roughly 1700 m in thickness, overlying Precambrian gneisses. The structure comprises three concentric rings surrounding a central basin with interior peaks. The authors present a detailed description of this site. They describe the ring structure, the central peaks, circumferential and normal faulting and details of impact breccia and shatter cones. The magnetic and gravity anomalies of this feature are described. (26 refs.)

121248 Meteor Crater: historical note on nomenclature. W.G.Hoyt (Lowell Obs., Flagstaff, AZ, USA).
Meteoritics (USA), vol.18, no.2, p.159-63 (30 June 1983).
The question of the crater's name has been a subject of minor controversy for many years and, in the earlier decades of the 20th century, was entangled in a larger controversy over the crater's origin. Although of little scientific consequence, this lesser controversy is nonetheless of some historical interest. It is summarized in this note for the first time, supplemented by documentary material not heretofore cited in the literature pertaining to the crater. (30 refs.)

121249 Signature extension versus retraining for multispectral classification of surface mines in arid regions. J.R.Carr, C.E.Glass, R.A.Schowengerdt (Univ. of Arizona, Tucson, AZ, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1193-9 (Aug. 1983).
Because governmental agencies are responsible for conducting mined land inventories on a regular basis, it is desirable to standardize the manipulation of the digital Landsat data for this purpose. Supervised classification of Landsat images is used to map Arizona copper mining activity in order to demonstrate the utility of these images for dynamic, regional inventories of mined lands. A set of spectral signatures derived at a single, large mining complex were extended spatially and temporally to discriminate mining activity from natural terrain features at other sites. Accurate classifications are obtained using signature extension, and, in some cases, the accuracy exceeds that obtained by retraining the classifier for individual mines. (5 refs.)

121250 Use of a chromogenic film for aerial photography of erosion features. B.E.Frazier, G.K.Hooper (Agronomy & Soils Dept., Washington State Univ., Pullman, WA, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1211-17 (Aug. 1983).
The potential of Ilford XP1 photographic film in 35-mm format for aerial photo assessment of erosion was investigated. A wide exposure latitude (ASA 50 to ASA 1600) makes this film attractive for aerial photography where lighting conditions are variable and rapid shutter speeds are required. The film was field tested for image quality using exposures equivalent to ASA 100 to ASA 1000. Acceptable prints were obtained throughout the range ASA 100 to ASA 1000. A bar chart photographed at ASA 1000 showed separable line pairs 25.4 mm in width, equivalent to 35 line pairs/mm on the negative. Examples show that the film is useful for documenting the effects of erosion after cultivation and for measuring rills or soil slips. (5 refs.)

121251 Flandrian relative sea level changes in the Ythan valley, northeast Scotland. D.E.Smith (Dept. of Geography, Coventry Polytech., Coventry, England), R.A.Cullingford, C.L.Brooks.
Earth Surf. Processes & Landforms (GB), vol.8, no.5, p.423-38 (Sept.-Oct. 1983).
Relict Flandrian estuarine deposits in the Ythan valley are confined to an area in the lower valley around the present estuary. The vegetational context and age of these deposits are determined at Waterside, near the mouth of the present estuary. Here the grey silty clay accumulated as the result of a marine transgression which began in the Early Flandrian, and culminated between about 6189±95 and some time time prior to 4000±80 radiocarbon years BP. The carseland surface produced by this phase of accumulation is correlated with the Main Postglacial Shoreline elsewhere in eastern Scotland. Withdrawal of the sea from this level may have been interrupted by the formation of a lower carseland surface before present levels were reached, though this level may have been interrupted by the formation of a lower carseland surface before present levels were reached, though this is far from certain. The grey, micaceous, silty fine sand layer is dated at approximately 6850±140 radiocarbon years BP and is correlated with similar layers that may have been deposited following a storm surge. The authors conclude with some considerations on the age and distribution of the Main Postglacial Shoreline in eastern Scotland. (24 refs.)

121252 Observations of nonstationary turbulence in an estuary. K.Kawanisi, S.Yokosi (Hiroshima Univ., Hiroshima, Japan).
Bull. Fac. Eng. Hiroshima Univ. (Japan), vol.31, no.1, p.53-60 (Jan. 1983). In Japanese.
The turbulent fluctuations of velocity were measured in an estuary, using a two-component electromagnetic flowmeter. The evolution of $\langle u^2 \rangle$, $\langle w^2 \rangle$, $\langle uw \rangle$ spectra, Reynolds stresses and energy dissipation rate were estimated. The maximum value of $\langle u^2 \rangle$ spectra in the low frequency range was observed just after the ebb tide. The maximum values of $\langle u^2 \rangle$, $\langle w^2 \rangle$, $\langle uw \rangle$ spectra in the high frequency range were observed directly before the ebb tide. The Reynolds stress $-\langle uw \rangle$ was positive, while the mean velocity $\langle u \rangle$ was negative. The fluctuation of the main contribution to the Reynolds stresses was about 1 Hz. The maximum values of Reynolds stresses and energy dissipation rate were observed just before the ebb tide. (9 refs.)

121253 Abyssal characteristics of the World Ocean waters. A.W.Mantyla, J.L.Reid (Scripps Instn. of Oceanography, Univ. of California, San Diego, La Jolla, CA, USA).
Deep-Sea Res. Part A (GB), vol.30, no.8A, p.805-33 (Aug. 1983).
The abyssal characteristics of the World Ocean, including not only temperature but salinity, density, oxygen, and silica, are displayed on both maps and vertical sections to examine the origins of the waters of some of the major basins. Although the coldest waters that appear at the bottom in each of the oceans have long been known to have come from the Southern Ocean, the characteristics indicate that the major component of the abyssal waters of the World Ocean does not derive directly from the abyssal Antarctic but from the shallower Circumpolar Water. (53 refs.)

121254 A study of sub-inertial waves off the west coast of Mexico. N.Christensen,Jr., R.de la Paz V., G.Gutierrez V. (Centro de Investigacion Cientifica y de Educacion Superior de Ensenada, Ensenada, Mexico).
Deep-Sea Res. Part A (GB), vol.30, no.8A, p.835-50 (Aug. 1983).
Sea-level records from 16 stations along the west coast of Mexico reveal that events with 10-day time scales and amplitudes of 20 cm propagate northward along the Pacific mainland coast of Mexico and die off in the Gulf of California. The sea-level events have an offshore scale of <200 km, phase speed of 2 to 4 m s^{-1}, produce no net transport, and occur predominantly in summer. The characteristics are compared with those of theoretical and numerical Kelvin, shelf, and hybrid modes of coastally trapped waves. They resemble a hybrid form, part first mode internal Kelvin wave and part shelf wave. (19 refs.)

121255 Coastal currents in low latitudes (with application to the Somali and El Nino currents). S.G.H.Philander, P.Delecluse (Geophys. Fluid Dynamics Lab./NOAA, Princeton Univ., Princeton, NJ, USA).
Deep-Sea Res. Part A (GB), vol.30, no.8A, p.887-902 (Aug. 1983).
Near the equator, the directly wind-driven coastal jet along the western boundary of an ocean basin differs from its counterpart along the eastern boundary in several respects. (1) The western boundary current is more intense by an order of magnitude. (2) In the west the flow at the depth of the thermocline is still in the direction of the wind, but in the east the pressure force drives an undercurrent that is practically as strong as the surface current. (3) Variability on time scales from a week to months is much higher in the east than the west. (4) On time scales longer than a month long Rossby waves disperse the eastern boundary current westward, but the western current remains a coastal jet. (5) A relaxation of the wind causes a prompt reversal in the direction of the flow in the east but in the western region, where the current flows 'downhill', there is only a gradual deceleration. The relevance of these results to the Somali current in the western Indian Ocean and El Nino Current in the eastern equatorial Pacific Ocean is discussed. (19 refs.)

121256 On the wave number spectrum of oceanic mesoscale variability observed by the SEASAT altimeter. Lee-Lueng Fu (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4331-41 (20 May 1983). [received: Oct. 1983]
Variations of sea surface height measured by the SEASAT altimeter in nearly repeat orbits during the last 24 days of the mission are used to compute the wave number spectrum of mesoscale variability in various parts of the oceans. The instrument noise level has limited the resulting oceanic spectrum to wavelengths longer than 100 km. The characteristics of the oceanic spectrum were found to be dependent on the energy level of the mesoscale variability. In the high-energy areas close to major current systems, most of the energy is contained at wavelengths longer than 250 km. At wavelengths shorter than 250 km the spectrum basically follows a k^{-5} (k is wave number) dependence. Based on the assumption of horizontal isotropy of mesoscale variability, scalar-wave number spectra of sea surface height and geostrophic kinetic energy are also presented. Dynamical implications of the spectra are discussed. (40 refs.)

121257 Global mesoscale variability from collinear tracks of SEASAT altimeter data. R.E.Cheney, J.G.Marsh (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), B.D.Beckley.
J. Geophys. Res. (USA), vol.88, no.C7, p.4343-54 (20 May 1983). [received: Oct. 1983]
In 1978, during the last 25 days of the SEASAT mission, the satellite ground tracks repeated within 2.5 km every 3 days. This yielded eight to nine sets of global collinear altimeter data with a cross-track grid spacing of approximately 900 km at the equator and 600 km at mid-latitude. Such observations can reveal sea surface height variability due to dynamic ocean phenomena. The authors solved for variations due to deep-ocean mesoscale features by eliminating the longer wavelength deviations. The sea height profiles have a precision of a few centimeters, and the global variability map constructed from these data reveals a strikingly realistic view of mesoscale energetics. Maximum values of 20-40 cm rms variability are generated by meanders and eddies of five major current systems. A more significant discovery was the dominance of exceedingly small variability over vast regions of the oceans; approximately 70% of all global values were less than 5 cm. With such a low level of background noise, even some currents with relatively small sea height signatures could be detected. (68 refs.)

121258 Eddy kinetic energy in the North Atlantic from surface drifters. P.L.Richardson (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4355-67 (20 May 1983). [received: Oct. 1983]
One hundred ten satellite-tracked freely drifting buoys measured velocities and trajectories of the near-surface currents in the North Atlantic. Mean velocity values and the velocity variance about the mean were calculated for different regions. A horizontal map of eddy kinetic energy was prepared on a 2°×2° grid between latitudes 20° and 55°N. Maximum eddy energy (~ 3000 cm^2 s^{-2}) coincides with the high speed Gulf Stream jet where it begins large amplitude meanders near 37°N 67°W. A tongue of high eddy energy coincides with the Stream's path eastward and around the Grand Banks into the Newfoundland Basin. The circulation in other parts of the North Atlantic are also described based on observations between 1971 and 1981. (38 refs.)

121259 Vertical dispersion of inertial waves in the upper ocean. D.M.Rubenstein (Sci. Applications Inc., McLean, VA, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4368-80 (20 May 1983). [received: Oct. 1983]
A linear model of the vertical dispersion of near-inertial waves is developed. A porosity distribution near the bottom of the computational domain minimizes bottom reflections and simulates an ocean of infinite depth. The model is used to show that the vertical dispersion of near-inertial waves in the upper ocean may, under certain conditions, contribute significantly to the observed rapid decay of inertial oscillations in the surface layer. The kinetic energy of inertial oscillations at mid-latitudes decays with an e folding time scale of 10 days or less, when the parameter $\lambda(\mathrm{km})/N(\mathrm{cph})d(\mathrm{m})$ is less than or of the order of unity, where λ is the wavelength of the wind-generated near-inertial waves, N is the Vaisala frequency in the upper pycnocline, and d is the surface layer thickness. At the top of the pycnocline the model predicts a velocity maximum, which develops as energy propagates downward, out of the surface layer. (16 refs.)

121260 The sampling variability of estimates of spectra of wind-generated gravity waves. M.Donelan (Nat. Water Res. Inst., Burlington, Ontario, Canada), W.J.Pierson.
J. Geophys. Res. (USA), vol.88, no.C7, p.4381-92 (20 May 1983). [received: Oct. 1983]
The sampling variability of spectra of wind-generated waves is tested against the predictions of the theory of waves as a stationary random quasi-Gaussian process. Both laboratory data, in which stationarity was prescribed, and field data, in which the external conditions were remarkably steady, were treated in the same way. It is demonstrated that the theory of stationary Gaussian processes provides accurate estimates of the sampling variability. For a record length of 17 min, commonly used in wave monitoring at sea, the uncertainties in the significant height and peak frequency estimates are approximately ±12% and ±5% respectively at the 90% confidence level. Furthermore, the height of the peak of the spectrum is generally overestimated. (17 refs.)

121261 SEASAT synthetic aperture radar observations of wave-current and wave-topographic interactions. G.A.Meadows, R.A.Shuchman, Y.C.Tseng, E.S.Kasischke (Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4393-406 (20 May 1983). [received: Oct. 1983]
This study investigated the capability of a spaceborne, imaging radar system to detect subtle changes in the propagation characteristics of ocean wave systems. Specifically, an evolving surface gravity wave system emanating from Hurricane Ella and propagating toward Cape Hatteras, North Carolina, formed the basis of this investigation. This wave system was successfully imaged by the SEASAT synthetic aperture radar (SAR) during revolution 974 on September 3, 1978. Estimates of the dominant wavelength and direction of the ocean waves were derived from the SAR data by using optical Fourier transforms. Favorable agreement was found between wave rays calculated by utilizing theoretical wave-current and wave-topographic interactions and SAR observed dominant wavelength and direction changes across the Gulf Stream and continental shelf. (32 refs.)

121262 Imaging radar observations of directional properties of ocean waves. W.McLeish, D.B.Ross (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4407-19 (20 May 1983). [received: Oct. 1983]
The present work attempts to derive some properties of hurricane-generated ocean waves from radar measurements without a full knowledge of the transfer relationship. A procedure of presenting the radar spectra as directional distributions that are interpreted within a number of restrictions has been developed. Both side-looking real aperture airborne radar (SLAR) and satellite synthetic aperture radar (SAR) images were analyzed. The SLAR results were tested in part against reference wave measurements. The reference data available did not furnish directional distributions of wave energy adequate to evaluate fully those from the SLAR. A more critical test of the radar results has been a comparison of SAR wave imagery with the unique wind patterns within a hurricane. In this case, the radar-derived directional distributions could be related to the generating wind fields in some detail. In addition, the radar images showed some further directional properties of a swell as it spread across the ocean surface. (33 refs.)

121263 Wave-current interactions on a slowly varying topography. P.L.-F.Liu (School of Civil & Environmental Engng., Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4421-6 (20 May 1983). [received: Oct. 1983]
A parabolic approximation formulation is presented to study the wave-current interactions on a slowly varying topography. Model equations are first derived

from the mild-slope assumption. A parabolic approximation is then applied to convert a boundary value problem to an initial value problem. Several limiting cases are discussed. Numerical examples are given for the case concerning the interactions between jet-like currents and normal incident waves on a sloping beach (Arthur, 1950). (15 refs.)

121264 Observations of near-surface currents and temperature in the central and western tropical Atlantic Ocean. R.L.Molinari (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4433-8 (20 May 1983). [received: Oct. 1983]
Eleven satellite-tracked drifting buoys were deployed in the central South Atlantic Ocean during two austral summer and two austral winter cruises. Between 7°S and 11°S and 23°W and 31°W during austral winter, net buoy drift was to the west. Surface geostrophic flow was to the east between 7°S and 9°S. It is proposed that strong southeast trade winds can induce directly driven surface flows to the west that are more intense than the eastward geostrophic flows associated with the South Equatorial Countercurrent (SECC). The North Brazilian Coastal Current, the Brazil Current and the North Equatorial Countercurrent were also studied. Temperature data obtained as the buoys drifted westward and northward suggest that increases in upper layer heat content can be attributed to heat fluxes through the sea surface. (18 refs.)

121265 Variability of current, temperature, and bottom pressure across the West Florida continental shelf, winter 1981-1982. G.O.Marmorino (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4439-57 (20 May 1983). [received: Oct. 1983]
Observations are analyzed from four current meter moorings deployed on the broad continental shelf in the northeastern Gulf of Mexico from November 29, 1981, to February 8, 1982. Consistent with recent modeling studies, the shelf circulation responds within an inertial period to the alternating up-and-down-coast synoptic scale wind forcing. Average response to a 0.5 dyn cm^{-2} alongshore wind stress is ~20 cm s^{-1} off Cedar Key and ~40 cm s^{-1} in the north where the shelf narrows. Lower layer currents veer counterclockwise with depth, as in a bottom Ekman layer. The pressure field decays offshore and yields a geostrophic current in good agreement with the observed alongshelf flow. Cross-shelf and vertical variations of the tidal signals compare nicely with results from barotropic theory. Calculations indicate that most of the shoreward propagating tidal energy must be dissipated in depths of <20 m. (36 refs.)

121266 Nonlinear features of internal waves off Baja California as observed from the SEASAT imaging radar. J.R.Apel, F.I.Gonzalez (Environmental Res. Labs., NOAA, Seattle, WA, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4459-66 (20 May 1983). [received: Oct. 1983]
The synthetic aperture radar (SAR) on SEASAT has yielded well-defined images of quasi-periodic internal waves in the waters on the west side of Baja California. These waves occur in groupings separated by 15-23 km, each group having 2-20 striations with wavelengths of the order of 300 m or longer. They appear in water approximately 200 m deep, shoreward of several banks at the continental shelf edge whose depths are as shallow as 15 m. The wave surface signatures exhibit clear nonlinear features: higher-than-linear group velocities, and decreases in wavelength, crest length, and amplitude toward the rear of the packet. The observations indicate that stratification, wind speed, tidal current, and bottom topography apparently combine to establish proper conditions for tidal generation of internal waves. The images have been analyzed from the standpoint of nonlinear wave theory. (24 refs.)

121267 Physical/biological structure and exchange across the thermohaline shelf/slope front in the New York Bight. R.W.Houghton, J.Marra (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4467-81 (20 May 1983). [received: Oct. 1983]
During the summer, the shelf/slope water in the New York Bight is thermohaline with strong temperature and salinity gradients occurring on isopycnals connecting shelf and slope water. The dominant lateral exchange is via slope water intrusions above and below the cold pool, a remnant of winter-mixed shelf water. These intrusions create environments favorable for double-diffusive processes. However, measured values of the density ratio R_ρ over the shelf imply weak vertical mixing ($K_\nu \sim 10^{-1}$ cm^{-1}), which is consistent with heat and salt fluxes into the persistent cold pool. Convergent circulation driven by cabbeling and vertical mixing enhanced by double-diffusion at the outer edge of the cold pool may be responsible for the abrupt deepening of the chlorophyll *a* maximum layer. (56 refs.)

121268 Measurements of subtidal flow in the Lesser Antilles passages. P.A.Mazeika, T.H.Kinder, D.A.Burns (Naval Ocean Res. & Dev. Activity, NSTL Station, MS, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4483-8 (20 May 1983). [received: Oct. 1983]
During 1977 the authors obtained current meter records for up to 284 days' length in the two southernmost passages of the Lesser Antilles, St. Vincent Passage, and Grenada Passage. The sub-inertial velocity variances accounted for 15-77% of the total record variances and the amplitudes of these sub-inertial fluctuations were similar to record means. The deepest current meters (25-150 m above bottom) had oscillations of about a 14 day period, whereas shallower current meters (greater than 400 m above bottom) were dominated by fluctuations with greater than 30 day periods. (17 refs.)

121269 Atmosphere-sea ice interactions in the Beaufort/Chukchi Sea and in the European sector of the Arctic. R.G.Crane (Dept. of Geography, Univ. of Colorado, Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.C7, p.4505-23 (20 May 1983). [received: Oct. 1983]
Electrically Scanning Microwave Radiometer (ESMR) data for 'winter' months, November 1973 to April 1974, and for 'summer', May to October 1974, are used to examine the synoptic scale sea ice-atmosphere interactions over the Beaufort/Chukchi Sea and the European sector of the Arctic. The synoptic scale variability in the microwave brightness temperatures and sea level atmospheric pressure and temperature is examined through the use of principal components analysis. Changes occurring in the ice ablation season are found to be responsible for much of the variance in the data. Canonical correlations are used to derive the leads to lags in the ice-atmosphere system. Positive feedbacks are identified between the ice and the atmosphere, and the direction of the ice-atmosphere forcing is found to vary both seasonally and regionally, and also between the areas of permanent pack and the seasonal sea ice zone. (29 refs.)

121270 Determining the form drag contribution to the total stress of the atmospheric flow over ridged sea ice. S.M.Joffre (Inst. of Marine Res., Helsinki, Finland).
J. Geophys. Res. (USA), vol.88, no.C7, p.4524-30 (20 May 1983). [received: Oct. 1983]
Profile measurements from a meteorological mast installed in the middle of a sea ice floe in the Bothnian Bay allowed the skin roughness parameter and drag to be computed. Radiosonde and pibal profiles at the same location enabled the large-scale stress and roughness parameter to be estimated by the geostrophic departure method. The generally significant form drag contribution appears to depend also on thermal stability. These results are compared with the predictions from a model of Arya (1975) as a function of sea ice surface features statistics. The qualitive agreement is good, but uncertainty in the numerical values is considerable. (17 refs.)

121271 On the response of a wind-driven current over a continental shelf. E.Maeland (Seismological Obs., Univ. of Bergen, Bergen, Norway).
J. Geophys. Res. (USA), vol.88, no.C7, p.4534-8 (20 May 1983). [received: Oct. 1983]
The response of a coastal current forced by a steady wind stress over a sloping continental shelf is investigated. A Laplace transform technique is used, and it is shown that in the adjustment to a steady state the response consists of a damped, propagating disturbance, carrying energy offshore and longshore. This may be associated with shelf waves, but the response is not related to any poles of the image function. The spectrum is continuous, and a discrete set of 'normal modes' does not exist. (9 refs.)

121272 Low-frequency current and temperature variability from Gulf Stream frontal eddies and atmospheric forcing along the southeast US outer continental shelf. T.N.Lee (School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA), L.P.Atkinson.
J. Geophys. Res. (USA), vol.88, no.C8, p.4541-67 (30 May 1983). [received: Oct. 1983]
Low-frequency current and temperature time series from the outer shelf between Cape Canaveral, Florida, and Cape Romain, South Carolina, are compared with shipboard hydrographic data, satellite VHRR, coastal and buoy winds, and coastal sea level during the period from February to June 1980. Low-frequency current and temperature variability along the shelf break was primarily produced by cyclonic, cold core Gulf Stream frontal eddies. These disturbances traveled to the north at speeds of 50 to 70 cm s^{-1} with periods of 5 to 9 days and produced cold cyclonic perturbations of the northward mean flow and temperature fields over an along-shelf coherence scale of 100 km. Frontal eddies appear to be an important mechanism in the observed eastward transport of northward momentum and heat along the shelf edge. Cold core upwelling and barotropic along-shelf current oscillations were also studied. (41 refs.)

121273 Gulf Stream frontal statistics from Florida Straits to Cape Hatteras derived from satellite and historical data. D.B.Olson, O.B.Brown, S.R.Emmerson (Rosenstiel School of Marine & Atmospheric Sci., Miami, FL, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4569-77 (30 May 1983). [received: Oct. 1983]
A 5 year record (1976-1980) of weekly Gulf Stream paths digitized from the US Navy Ocean Frontal Analysis is analyzed to define a mean Gulf Stream path and weekly space-time series of fluctuations about the mean between the Florida Straits and Cape Hatteras. This satellite-derived Gulf Stream frontal mean locus is used as a natural coordinate system in which NODC historical expendable bathythermograph (XBT) data is averaged to determine the mean cross stream thermal structure. The results show that the satellite-derived front, that is, the cold wall of the stream as derived from IR imagery, is in good agreement with a classical definition of the stream path. The Gulf Stream path is discussed in relationship to the bottom topography. Frontal location time series at various locations along the Gulf Stream are analyzed to generate occupation statistics and spectra for stream position. (25 refs.)

121274 Diagnostic and prognostic numerical circulation studies of the South Atlantic Bight. A.F.Blumberg, G.L.Mellor (Dynalysis of Princeton, Princeton, NJ, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4579-92 (30 May 1983). [received: Oct. 1983]
Some of the results from a series of diagnostic and prognostic numerical simulations of the circulation in the South Atlantic Bight (SAB) are described. The numerical model developed for the study is a three-dimensional, primitive equation, time dependent, σ coordinate model with an imbedded, turbulent closure submodel which should yield realistic Ekman surface and bottom layers. An implicit numerical scheme in the vertical direction and a mode-splitting technique in time are adopted for computational efficiency. A significant portion of the paper is concerned with realistic specification of initial conditions for temperature and salinity, surface forcing, and lateral open boundary conditions. (33 refs.)

121275 Comparison of the TIROS-N satellite and aircraft measurements of Gulf Stream surface temperatures. R.Legeckis (Nat. Earth Satellite Service, Washington, DC, USA), J.M.Bane,Jr..
J. Geophys. Res. (USA), vol.88, no.C8, p.4611-16 (30 May 1983). [received: Oct. 1983]
A comparison is made between multi-channel infrared (3.7 and 11 μm) temperatures measured by the TIROS-N satellite and aircraft single channel radiometer and AXBT measurements over the Gulf Stream between Cape Hatteras and Savannah, Georgia, on November 27, 1979. After reducing the noise in the 3.7 μm TIROS-N data, a multi-channel method is used to estimate the sea surface temperatures. For a temperature band of 19 to 26°C, the estimated and AXBT measurements are in agreement within a standard error estimate of 0.5°C. A bias of 1.2°C was found between the aircraft radiometer and the AXBT measurements, and part of this bias is attributed to radiometer calibration errors. (10 refs.)

121276 On Gulf Stream variability and meanders over the Blake Plateau at 30°N. T.N.Lee (School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA), E.Waddell.
J. Geophys. Res. (USA), vol.88, no.C8, p.4617-31 (30 May 1983). [received: Oct. 1983]
Current and temperature variability of the Gulf Stream at 30°N was observed with a subsurface array of current meter moorings from August 1980 to October 1981. Energetic current fluctuations in the 2-14 day period band accounted for 45-70% of the total observed variability. Flow perturbations in the cyclonic shear zone tended to have a cyclonic sense of rotation and were 180° out of phase from anticyclonic flow perturbations within the anticyclonic shear region. These fluctuations appear to result from northward propagating wave-like meanders of the Gulf Stream axis. The fluctuations do not appear to be directly related to local wind forcing. Observations of near-bottom flow on the Blake Plateau east of the Gulf Stream showed periods of prolonged southward currents lasting up to 40 days with speeds in

excess of 30 cm s^{-1}. The mean flow was also southward due to these strong events. The source of the southward flow is unknown. (32 refs.)

121277 Gulf Stream meanders off North Carolina during winter and summer 1979. D.A.Brooks (Dept. of Oceanography, Texas A&M Univ., College Station, TX, USA), J.M.Bane,Jr..
J. Geophys. Res. (USA), vol.88, no.C8, p.4633-50 (30 May 1983). [received: Oct. 1983]
Meanders produced most of the subtidal variability in the Gulf Stream off North Carolina during 1979. Recording instruments were moored in the lower half of the water column over the 200-m and 400-m isobaths for two periods of 4 months, one in the late winter and one in the late summer. In both seasons, the middepth current speed typically fluctuated between -50 cm s^{-1} and $+100$ cm s^{-1} about a 30 cm s^{-1} downstream mean. The velocity, temperature, and salinity fluctuations had a prominent weekly time scale in the winter, caused by the meandering stream. In the summer the weekly time scale was less prominent within a generally energetic 3- to 10-day period band. The observations collectively point to an upstream source of meander energy, most probably made available by an instability of the Gulf Stream. (28 refs.)

121278 Subsurface energetics of the Gulf Stream cyclonic frontal zone off Onslow Bay, North Carolina. C.A.Hood, J.M.Bane,Jr. (Marine Sci. Program, Univ. of North Carolina, Chapel Hill, NC, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4651-62 (30 May 1983). [received: Oct. 1983]
It has been shown with the use of 4-month-long time series of velocity, temperature, and conductivity that fluctuating kinetic and potential energy was converted into kinetic and potential energy of the mean flow following a fluid particle in the subsurface Gulf Stream cyclonic frontal zone off Onslow Bay, North Carolina, during early 1979. These flux calculations represent an important step in verifying the direction, of the net cross-stream energy flux within the stream off Onslow Bay. According to an hypothesis presented for the growth and decay of Gulf Stream meanders along the continental margin of the southeastern United States, Onslow Bay is an area of decreasing meander amplitude. The direction of the energy conversion from meanders to the mean flow, determined from the authors' calculations, is consistent with this hypothesis. (37 refs.)

121279 Temperature and current variability of a Gulf Stream meander observed off Onslow Bay, August 1977. E.R.Levine (Naval Underwater Systems Center, Newport, RI, USA), J.M.Bergin.
J. Geophys. Res. (USA), vol.88, no.C8, p.4663-71 (30 May 1983). [received: Oct. 1983]
Eighteen temperature sections were obtained during August 1977 using expendable bathythermograph probes along a 110 km tract oriented perpendicular to the mean direction of the Gulf Stream off Onslow Bay. Concurrent velocity and temperature measurements were obtained beneath the Stream from an Aanderra current meter moored 48 m above the bottom (620 m depth). The measurements revealed the passage of a Gulf Stream meander with a period of approximately 5 days, vertical changes in isotherm level as large as 200 m, and a lateral meander amplitude of approximately 39 km as defined by the 16°C isotherm at 200 m. A study of the meander amplitude as a function of depth is carried out in terms of the migration of the sloping frontal surface. (22 refs.)

121280 Initial observations of the subsurface structure and short-term variability of the seaward deflection of the Gulf Stream off Charleston, South Carolina. J.M.Bane,Jr. (Dept. of Phys., Univ. of North Carolina, Chapel Hill, NC, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4673-84 (30 May 1983). [received: Oct. 1983]
A recurring seaward deflection of the surface layer of the Gulf Stream has been observed near 32°N latitude off the coast of the southeastern United States. It has been suggested that a ridge and trough bottom feature (the so-called 'Charleston Bump') on the upper continental slope off the Georgia/South Carolina coast produces the deflection through a bottom steering effect. Present data indicate that the deflection is great enough to direct the Gulf Stream's shoreward surface thermal front to the east, and even south of east, about 70% of the time. Air-deployed expendable bathythermograph surveys have been made with sufficient coverage to provide several synoptic, three-dimensional views of the Gulf Stream's thermal frontal zone in the region between Savannah, Georgia, and Cape Hatteras, North Carolina. These views show the subsurface structure of the seaward deflection to exhibit large short-term variability. (22 refs.)

121281 Cape Romain and the Charleston Bump: historical and recent hydrographic observations. J.J.Singer (Sci. Applications Inc., Raleigh, NC, USA), L.P.Atkinson, J.O.Blanton, J.A.Yoder.
J. Geophys. Res. (USA), vol.88, no.C8, p.4685-97 (30 May 1983). [received: Oct. 1983]
A review and analysis of historical and new hydrographic data are presented for the Charleston Bump region. An area of doming isotherms is identified primarily between 31.5° and 34.5°N and the 200 and 400 m isobaths. The highest incidences of doming are found off long Bay (86%), Cape Fear (38%), and Cape Romain (25%). Evidence suggests that low salinity shelf water collects in the doming area off Long Bay in July and that seasonal fluctuations in the depth of the main thermocline layer in this area are linked to Gulf Stream transport and local winds. At times there is a gradual offshore-onshore movement of the Gulf Stream opposite Long Bay roughly following the 400 m isobath and at other times an abrupt eastward movement near 32°N. Much of the time there appears to be a direct seasonal relationship between historical seasonal velocity fields and offshore deflection. (81 refs.)

121282 Distribution of Antarctic Intermediate Water over the Blake Plateau. L.P.Atkinson (Skidaway Inst. of Oceanography, Savannah, GA, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4699-704 (30 May 1983). [received: Oct. 1983]
During a cruise in September 1980 over the Blake Plateau the author observed a northward spread of Antarctic Intermediate Water (AAIW) in the main axis of the Gulf Stream. The AAIW appeared as a lobe less than 60 km wide extending to at least 31°N. The lobe was characterized by negative salinity anomalies of 0.15×10^{-3}, elevated nutrient concentrations, and lowered oxygen concentrations. Tentative evidence suggests that a parcel of AAIW was located over the central Blake Plateau, and geostrophic calculations indicate it may have been attached to the main Gulf Stream deep flow. (27 refs.)

121283 Climatology of the southeastern United States continental shelf waters. L.P.Atkinson (Skidaway Inst. of Oceanography, Savannah, GA, USA), T.N.Lee, J.O.Blanton, W.S.Chandler.
J. Geophys. Res. (USA), vol.88, no.C8, p.4705-18 (30 May 1983). [received: Oct. 1983]
Data from 2872 hydrographic stations have been used to determine the oceanographic climatology of the southeastern United States continental shelf waters. The data were sorted by each degree of latitude and by depth into three zones (0-20 m, 21-40 m, 41-60 m). Inner shelf water temperatures were similar to adjacent land air temperatures, while outer shelf temperatures were moderated by the Gulf Stream. Minimum and maximum water temperatures occurred in Georgia and South Carolina inner shelf water. Bottom temperatures were unusually low off Florida in the summer probably because of shelf break upwelling. Surface salinity was lowest adjacent to the rivers and reached minima in the spring at the time of high runoff. Heat flow values and bulk stratification estimates are presented. (36 refs.)

121284 Nearshore coastal currents on the South Carolina continental shelf. F.B.Schwing (Skidaway Inst. of Oceanography, Savannah, GA, USA), B.Kjerfve, J.E.Sneed.
J. Geophys. Res. (USA), vol.88, no.C8, p.4719-29 (30 May 1983). [received: Oct. 1983]
Simultaneous current, sea level, wind, and atmospheric pressure data from the South Carolina nearshore shelf during the summer are analyzed and compared. The current record was taken in the nearshore region at 10 m depth, an area where the current regime has not been well studied. Most of the variance in the series is concentrated in two frequency bands: (1) 2-12 days (meteorological) and (2) 12-25 hours (tidal and daily). The variance of the two bands is approximately equal in both the alongshore and the cross-shore current compoennts, but net flow is primarily due to low frequency events. The nearshore current flows predominantly to the northeast, possibly an Ekman response to the northerly blowing wind regime. Current reversals occur in response to frontal passages approximately every 6 days. Sea-level variability was also studied. (37 refs.)

121285 Transport and fate of river discharge on the continental shelf of the southeastern United States. J.O.Blanton, L.P.Atkinson (Skidaway Inst. of Oceanography, Savannah, GA, USA).
J. Geophys. Res. (USA), vol.88, no.C8, p.4730-8 (30 May 1983). [received: Oct. 1983]
Eight years of wind and salinity data from a frontal zone in a region of the inner continental shelf off the southeastern United States have been analyzed. The changes in low-salinity water stored in the frontal zone have been parameterized by analyzing the monthly rate of change in freshwater content. When the rate of change in freshwater content was negative, the authors interpreted this as a loss of low-salinity water from the frontal zone. When this parameter was compared with seasonally averaged alongshore wind stress, the rate of loss was independent of the alongshore wind stress magnitude until threshold of about 0.1 dyne cm^{-2} was reached. Above the threshold there was a clear relationship between northward alongshore wind stress and rate of loss of freshwater from the inner shelf. (22 refs.)

121286 Anomalous refraction and conjugate solutions of finite-amplitude water waves. D.H.Peregrine, S.C.Ryrie (School of Math., Univ. of Bristol, Bristol, England).
J. Fluid Mech. (GB), vol.134, p.91-101 (Sept. 1983).
Calculations of the refraction of water waves obliquely incident on a beach indicate that in certain circumstances finite-amplitude waves are refracted to turn in a sense opposite to the refraction of linear waves. This is termed 'anomalous refraction'. It is demonstrated that similar solutions exist for a wide class of weakly nonlinear dispersive waves. When anomalous refraction solutions exist there are two 'conjugate' solutions satisfying the slowly varying wave equations. Properties of the conjugate solutions are given. Discussion of the possibility of jumps in wave properties between conjugate solutions and their relevance to refraction is in another paper (Peregrine 1983), which shows that the anomalous-refraction solution is not normally relevant on a beach. (13 refs.)

121287 Investigation of kinetics of microconvection of a water surface film. A.I.Lapshin, A.M.Trokhan.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.779-83 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.51-5 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors present the results of laboratory investigations of surface microconvection of the special surface film or skin layer existing on the surface of water. Fluorescent dyes in conjunction with the shadow method were used. Two forms of free convection currents were observed. The usual form was a jet with a spherical lower tip and was apparently a weakly developed eddy. In addition, convection currents in the form of vertical films were formed from the convergence bands in the surface film. On the leading edge of these films weak eddies of a droplike shape were also formed. (6 refs.)

121288 On the joint distribution of wave periods and amplitudes in a random wave field. M.S.Longuet-Higgins (Dept., of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.241-58 (8 Oct. 1983).
A theoretical probability density is derived for the joint distribution of wave periods and amplitudes which has the following properties: (1) the distribution is asymmetric, in accordance with observation; (2) it depends only on three lowest moments m_0, m_1, m_2 of the spectral density function. It is therefore independent of the fourth moment m_4, which previously was used to define the spectral width (Cavanie et al. 1976). In the present model the width is defined by the lower-order parameter $\nu=(m_0M_2/m_1^2-1)^{1/2}$. The distribution agrees quite well with wave data taken in the North Atlantic (Chakrabarti and Cooley 1977) and with other data from the Sea of Japan (Goda 1978). Among the features predicted is that the total distribution of wave heights is slightly non-Rayleigh, and that the interquartile range of the conditional wave period distribution tends to zero as the wave amplitude diminished. 121289 Thermodynamic properties in chemical reaction processes of seawater. H.Endo (Dept. of Appl. Phys., Nat. Defense Acad., Yokosuka, Japan), K.Shigehara.
J. Geophys. Res. (USA), vol.88, no.C7, p.4489-97 (20 May 1983). [received: Oct. 1983]
Theoretical expressions for thermodynamic parameters of the chemical reaction processes of ionic hydration in seawater are obtained by using the kinetic model of hydrated water molecules around ions in liquid water. Assuming the additivity law between the instantaneous (∞) thermodynamic quantities of electrolytes in seawater and that of the remaining nonhydrated water (i.e. free water), the relaxational (r) quantity of seawater is split from the equilibrium one (0) by subtracting the ∞ value. The quantity $(\partial T/\partial P)_{S.0}$, which may be related to potential temperature, can be divided into instantaneous and relaxation, respectively. The relaxational quantity $(\partial T/\partial P)_{S.r}$ always becomes negative, while the instantaneous one $(\partial T/\partial P)_{S.\infty}$ is always positive. Both absolute values of $(\partial T/\partial P)_S$ for r and ∞ decrease with increasing salinity and temperature, respectively. This fact is illustrated in terms of the ionic hydration. (48 refs.)

121290 Silver distributions and fluxes in north-east Pacific waters. J.H.Martin, G.A.Knauer, R.M.Gordon (Moss Landing Marine Labs., Moss Landing, CA, USA).
Nature (GB), vol.305, no.5932, p.306-9 (22 Sept. 1983).
In recent years significant knowledge has been gained about the oceanic distributions of several trace elements. However, relatively little is known about amounts of Ag in the ocean, and how this element cycles through it. The authors report that Ag levels are relatively low near the surface ($\sim$1 pmol kg^{-1}), and that concentrations more or less steadily increase with depth; for example, 23 pmol kg^{-1} at 2440 m, the deepest sample collected. In general, Ag depth profiles are similar to those observed for Cu. The near-surface cycles of Ag appears to be involved with particulate organic matter uptake-sinking-regeneration processes. (16 refs.)

121291 Dimethyl sulfide in the surface ocean and the marine atmosphere: a global view. M.O.Andreae, H.Raerndronck.
Science (USA), vol.221, no.4612, p.744-7 (19 Aug. 1983).
Dimethyl sulfide (DMS) has been identified as the major volatile sulfur compound in 628 samples of surface seawater representing most of the major oceanic ecozones. In the least three respects, its vertical distribution, its local patchiness, and its distribution in oceanic ecozones, the concentration of DMS in the sea exhibits a pattern similar to that of primary production. The global weighted-average concentration of DMS in surface seawater is 102 nanograms of sulfur (DMS) per liter, corresponding to a global sea-to-air flux of 39×10^{12} grams of sulfur per year. When the biogenic sulfur contributions from the land surface are added, the biogenic sulfur gas flux is approximately equal to the anthropogenic flux of sulfur dioxide. (31 refs.)

92.40 HYDROLOGY AND GLACIOLOGY

121292 Suspended sediment in rapid subsurface stormflow on a large field plot. D.H.Pilgrim (School. of Civil Engng., Univ. of New South Wales, Kensington, NSW, Australia), D.D.Huff.
Earth Surf. Processes & Landforms (GB), vol.8, no.5, p.451-63 (Sept.-Oct. 1983).
The occurrence of rapid movement of suspended sediment in subsurface stormflow on a large field plot in California is described. Concentrations of over 1000 mgl^{-1} were recorded in storms of only low to moderate intensity. The observed sediment was composed of uniformly fine-sized particles 4 to 8 μm in diameter. The mode of transport seems different from processes previously reported. Differences in sediment concentrations in different events, levels of ^{137}Cs on the sediment, and several other types of evidence indicate that the sediment was detached and entrained at the ground surface by raindrop impact and that the water and sediment flow occurred mainly through macropores in the soil. As conditions similar to those at the study site are not uncommon, it seems probable that the phenomeon may occur in many regions. (35 refs.)

121293 Variation in cross-sectional asymmetry of coarse bedload river channels. J.A.Milne (Dept. of Geography, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Earth Surf. Processes & Landforms (GB), vol.8, no.5, p.503-11 (Sept.-Oct. 1983).
Alternative indices of cross-section asymmetry are compared. Observed values of two preferred indices for 567 natural sections across eleven confined upland channels are predictably low along such low sinuosity reaches. Variation in asymmetry of sections located around confined but stable, and free-migrating bends is evaluated. Consideration of the fluence of bed topography emphasizes local plan curvature of bed forms as an important control on degree of asymmetry. Variation in indices for bed forms in similar planform locations indicates the levels of asymmetry at different stages of the transformation of channel geometry over time. (12 refs.)

121294 Charts representing water budget parameters for the GDR territory. A contribution to International Hydrological Programme of the socialist countries of Europe. E.Freydank (Tech. Univ. Dresden, Dresden, Germany), H.Glander, E.Glos, G.Glugla.
Z. Meteorol. (Germany), vol.33, no.4, p.244-57 (1983). In German.
This is a report on the activities of the GDR within the International Hydrological Programme of the socialist countries of Europe for the project 'Water budget charts of central and eastern Europe' (1931 to 1960). The paper contains a description of the production of the charts for the GDR territory (scale:1:1,000,000) representing the water budget elements precipitation, evaporation and run-off including their regional and time-related distribution, and a description of the water budget in parts of the GDR and in the whole of its territory. For the first time, corrected precipitation data were used, which has resulted in higher evaporation values than were hitherto known. (14 refs.)

121295 Reflective properties from a low-velocity lake-bottom. Wei Xing-wu (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Acust. (China), vol.8, no.3, p.179-87 (May 1983). In Chinese. [received: Oct. 1983]
Measurements of lake-bottom reflectivity for grazing angles between 7° and 90° were made using direct measuremnt in a lake. Acoustic and physical properties of the cores collected in situ were analysed in detail. It is proved that the bottom of the lake is a low-velocity sediment. A theoretical model of a four-layer fluid was built according to the cores; the layers were assumed to be homogeneous and absorbing. Theoretical computations were made using the model comparisons of theoretical and measured reflection coefficients were made at 500, 1000, 6300 and 10000 Hz, and a relatively satisfactory result was obtained. (10 refs.)

121296 ^{10}Be and Be in the Maurice River-Union Lake system of southern New Jersey. L.Lundberg, T.Ticich, G.F.Herzog, T.Hughes, G.Ashley, R.K.Moniot, C.Tuniz, T.Kruse, W.Savin.
J. Geophys. Res. (USA), vol.88, no.C7, p.4498-504 (20 May 1983). [received: Oct. 1983]
The ^{10}Be and Be contents of 22 samples taken from seven locations in the Maurice River-Union Lake system of southern New Jersey are reported. Bulk ^{10}Be contents range from 0.05 to 2.7 dpm/kg and Be from <0.1 to 2 ppm. Silicate minerals separated from Union Lake sediments appear to have a constant surface concentration of $\sim5\times10^5$ atom ^{10}Be/cm^2. Organic material is greatly enriched in Be: Hand-picked samples contain over 10 dpm/kg of ^{10}Be and 5 ppm of Be. The deposition rate of ^{10}Be in Union Lake is $\sim$1 atom/cm^{2}s. (22 refs.)

121297 Crater Lake revisited: concentration changes in water column radionuclides, 1967 to 1981. H.L.Volchok (Environmental Measurements Lab., US Dept. of Energy, New York, NY, USA), V.T.Bowen, W.R.Clark, L.R.Ball.
J. Geophys. Res. (USA), vol.88, no.C7, p.4531-3 (20 May 1983). [received: Oct. 1983]
A small-scale resampling of Crater lake water was carried out in 1981. Water from three depths (surface, 3 m, and 14 m) was obtained and analyzed for ^{3}H, ^{90}Sr, ^{137}Cs, and plutonium. The results indicate that ^{3}H and ^{90}Sr quantitatively remain in the water column and that the lake is well mixed. Twenty-five percent of the ^{137}Cs and more than 90% of the plutonium has been removed from the water column, presumably into the sediment. (14 refs.)

121298 Reduction of BOD by sedimentation in ponding zone front of a weir. A.Ichikawa, T.Nishiyama, K.Nishino (Dept. of Urban Engng., Univ. of Tokyo, Tokyo, Japan).
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.37, no.1, p.135-44 (March 1983). [received: Oct. 1983]
Proposes a method of the prediction and the simulation of the effect of sedimentation on flowing river water including biological oxygen demand (BOD) variations. The authors introduce the ideal settling basin theory, which is commonly applied to the water treatment works, to the analysis of actual river phenomena. This analytical method is applied to the ponding zone in front of Yotsuya-Honjuku Weir, at the middle regime of the Tama River, Japan. (5 refs.)

121299 Restoration of Norwegian lakes by reduction in sulphur deposition. R.F.Wright, A.Henriksen (Norwegian Inst. for Water Res., Oslo, Norway).
Nature (GB), vol.305, no.5933, p.422-4 (29 Sept. 1983).
Using data from a 1974-5 survey of major-ion chemistry and fish populations in 683 lakes in southern Norway, the authors predict that a 30% reduction in sulphur deposition will restore chemical conditions such that 22% of the lakes now experiencing fisheries problems should be able to support fish. (13 refs.)

121300 Modeling inland water quality using Landsat data. D.J.Carpenter (Dept. of Engng. Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), S.M.Carpenter.
Remote Sensing Environ. (USA), vol.13, no.4, p.345-52 (Sept. 1983).
Turbidity and algal pigment concentration of freshwater lakes have been modeled and predicted using Landsat multispectral scanner data as multiple linear predictors. Satellite data for an area in South East Australia during 1978 and 1979 were used along with ground based measurements from three lakes. Date-independent models for turbidity and algal pigment were obtained using the satellite data and from one lake. The Sun elevation was included to account for differences between dates, and the time of sample collection was included to compensate for diurnal variations in pigment fluorescence. These models were used to successfully predict these water quality parameters for this lake on a new occasion and for the two other lakes on three occasions. (11 refs.)

121301 Ground water contamination in the United States. V.I.Pye (Acad. of Natural Sci., Philadelphia, PA, USA), R.Patrick.
Science (USA), vol.221, no.4612, p.713-18 (19 Aug. 1983).
Ground water contamination in the USA is of increasing concern as 50% of drinking water comes from well water. Since groundwatr moves slowly, the contaminant may affect only a small portion of an aquifer for a long period of time. The contaminant sources are discussed together with their characteristics. Remedial action and aquifer rehabilitation are discussed. Groundwater protection is also discussed. (38 refs.)

121302 Aluminium chemistry and acidification processes in a shallow podzol on the Swedish westcoast. S.I.Nilsson (Dept. of Ecology & Environmental Res., Swedish Univ. of Agricultural Sci., Uppsala, Sweden), B.Bergkvist.
Water, Air & Soil Pollut. (Netherlands), vol.20, no.3, p.311-29 (Oct. 1983).
Processes pertinent to soil acidification with special emphasis on the solution of Al were studied in three adjacent small catchments on the Swedish westcoast, with mixed coniferous forest and shallow podzols (average soil depth 50 cm). Soil solution from different depths, groundwater and streamwater were

sampled. Separation of organic and inorganic Al species was done with an ion exchange technique. The concentration of organic Al species is linearly correlated with the concentration of dissolved organic C (r^2 varied from 0.38 to 0.69 with $p<0.001$). Data are compared with other studies, both recent and older ones. The possible influence from present-day levels of H^+ and sulphurous compounds in the atmospheric deposition is evaluated. (43 refs.)

121303 An improved technique for estimating mean depth of lakes. J.M.Omernik, A.J.Kinney (Corvallis Environmental Res. Lab., US EPA, Corvallis, OR, USA).
Water Res. (GB), vol.17, no.11, p.1603-7 (1983).
Describes a technique for determining mean lake depth utilizing a systematically aligned dot grid. This technique is, on average, 55% faster than the traditional planimeter methods, depending on the type of planimeter and the size and complexity of the lake. No detectable bias is associated with results from this technique compared with those of traditional planimeter methods. The relationship $N_D = \sqrt[4]{A}$; where N_D=the number of dots falling within the shoreline of the lake and A=the surface area of the lake in ft^2, gives a quick estimation of the number of dots that should fall within the shoreline boundary of a lake for optimum sampling. (9 refs.)

121304 Search for ^{36}Sl in Stripa site groundwaters. H.Bentley (Dept. of Hydrology & Water Resources, Tucson Univ., Tucson, AZ, USA), I.Brissaud, D.Elmore, H.Gove, X.Z.Ma.
Z. Phys. A (Germany), vol.313, no.3, p.243-4 (1983).
Four groundwater samples from the Stripa site have been analysed by accelerator mass spectrometry at the University of Rochester. The ^{36}Cl concentrations were found to range from 2×10^8 to 6×10^8 atoms per litre of water, whereas the modern concentration is two orders of magnitude lower. A subsurface original seems to be the explanation of these results. (8 refs.)

92.60 METEOROLOGY

(see also 43.28 Aeroacoustics and atmospheric sound)

121305 The life cycle of a tornadic cloud as seen from a geosynchronous satellite. R.J.Hung (Univ. of Alabama, Huntsville, AL, USA), J.C.Dodge, R.E.Smith.
AIAA J. (USA), vol.21, no.9, p.1217-24 (Sept. 1983).
The life span of a severe storm is on the order of a few hours. Rapid-scan infrared and visible observations from geosynchronous satellites can be useful for studying the life cycle of a severe convective storm. By using artificial colors for pixels representing blackbody temperatures of the cloud top, convective storms can be observed throughout their life cycles. In this paper clouds associated with a tornadic storm, the Ringwood, Oklahoma, tornado on May 29, 1977, are compared with those without a tornadic storm to illustrate how the infrared and visible observations from a geosynchronous satellite can be used to study the differences in their life cycles. The instability of the air mass and the meteorological background are discussed based on balloon observations. (20 refs.)

121306 Rain-induced amplitude scintillation on 8.2 km line-of-sight path at 30 GHz. M.H.A.J.Herben (Dept. of Electrical Engng., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Arch. Elektron. & Uebertragungstech. (Germany), vol.37, no.9-10, p.339-40 (Sept.-Oct. 1983).
Summarises the results of an experiment, set up at the Eindhoven University, in order to measure the incoherently scattered field component. Power density spectra of the rain-induced amplitude scintillation are computed and compared with the spectra obtained from scintillation caused by tropospheric turbulence. All measurements are performed at 30 GHz on an 8.2 km line-of-sight path between Eindhoven University (receiver 44 m above local ground) and the Netherlands PTT tower in Mierlo (transmitter 77 m above local ground). The diameter of the receive and transmit antenna apertures is 0.5 m. (8 refs.)

121307 The refraction equation for the boundary layer. V.P.Sibilev.
Astrometriya & Astrofiz. (USSR), no.49, p.71-4 (1983). In Russian.
The refraction equation is deduced for the boundary layer which greatly affects formation of refraction anomalies. (5 refs.)

121308 The vorticity area index. P.C.Werner (Humboldt-Univ. zu Berlin, Berlin, Germany).
Z. Meteorol. (Germany), vol.33, no.4, p.218-25 (1983). In German.
The Vorticity Area Index (VAI), which is a measure of cyclonic activity at the 500-mb level in the northern hemisphere and which is available for 12.00 GMT from 1946 to 1975 is subjected to a time-series analysis. The annual variation of the VAI is rather conspicuous and is, in the various seasons, marked by typical features for which there are in a number of cases distinct relations to the central European weather development. The VAI is marked by a long-term variation, and an additional distinct oscillation of 2.5 and 4.3 years and of 13 to 18 days—which are in agreement with other parameters describing the circulation regime. In a number of cases the VAI exhibits a significant reaction as to a certain state of solar activity. (13 refs.)

121309 Aerodynamic conditions for planting of wind-protection belts. III. The protection effect of a woodland strip. D.Benndorf (Tech. Univ. Dresden, Dresden, Germany), K.Klingbeil, F.Grunert.
Z. Meteorol. (Germany), vol.33, no.4, p.226-33 (1983). In German.
For pt.II see ibid., vol.32, no.3, p.165-75 (1982). From wind tunnel measurements made using models with strips of varying (i.e. high and low) blocking effect and distances between the strips, the optimum distances of strip appropriate to an effective protection have been obtained. The relation of the height of strips to the given roughness of soil and to the friction layer of the up-wind air flow is of major significance. Extrapolation of the results to other conditions is feasible if a suitable distortion factor is applied. (15 refs.)

121310 An attempt to estimate the depth of a snow cover using simulation models. M.Rachner (Forschungsinst. fur Hydrometeorologie, Berlin, Germany).
Z. Meteorol. (Germany), vol.33, no.4, p.234-43 (1983). In German.
Deals with an attempt to calculate the snow depth on the basis of daily values of meteorological elements such as precipitation, air temperature, global radiation or sunshine duration. The procedure consists of conceptual models to simulate the water equivalent of the snow cover and the snow density. The results are satisfactory but several restrictions, caused by the simplicity of the models used, are taken into account. (5 refs.)

121311 A description of the annual variation of the amount of precipitation. T.Reich (Forschungsinst. fur Hydrometeorologie, Berlin, Germany).
Z. Meteorol. (Germany), vol.33, no.4, p.258-66 (1983). In German.
Shows that an harmonic analysis of the annual variation of precipitation amounts does not lead to a major reduction of the number of parameters, and compares some indices to describe the annual variation. The index published by Sver (1973) seems to be most useful to describe regional differences in the annual variability of precipitation amounts. (14 refs.)

121312 The theoretical distribution of wind in the planetary boundary layer with circular isobars. Zhao Ming (Dept. of Meteorology, Pennsylvania State Univ., University Park, PA, USA).
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.209-26 (July 1983).
The equations of motions are solved for concentric circular flow in the planetary boundary layer (PBL) under the assumption of $K = l^2 |\partial v / \partial z|$ and gradient wind independent of radius r. The theoretical distribution of wind is obtained for $r \geq 300$ km. Other parameters of the PBL are also calculated. Finally, equilibrium of the forces in the PBL is analyzed. (10 refs.)

121313 An all-slope 24-hour summer energy budget regime along a climatic-latitudinal transect. W.H.Terjung, P.A.O'Rourke (Dept. of Geography, Univ. of California, Los Angeles, CA, USA).
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.227-42 (July 1983).
A physically-based solar radiation transmission model and a slope energy budget model is used to examine the diurnally changing energy budget components of net radiation, conduction, sensible, and latent heat flux occurring at all slope angles (0 to 90 deg) and slope directions (south-, west-, and north-facing). The analysis utilized two contrasting landscapes along a latitudinal transect of the east coast of the Americas. Among the results, the maximum net radiation for all slope angles and directions occurred at noon on a 40-deg, south-facing slope for latitude 60. (15 refs.)

121314 An error analysis of profile flux, stability, and roughness length measurements made in the marine atmospheric surface layer. T.V.Blanc (Atmospheric Phys. Branch, Naval Res. Lab., Washington, DC, USA).
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.243-67 (July 1983).
An analytical error analysis of profile-derived fluxes of heat, moisture, and momentum along with stability and roughness length, is performed using the accuracies of the constituent temperature, humidity, and wind speed measurements. Five experiments are compared. Typical profile-method measurement errors were found to range from 15 to 35% for a sensible heat flux of ± 10 $W\ m^{-2}$, from 15 to 105% for a latent heat flux of ± 100 $W\ m^{-2}$, from 10 to 40% for a stress of 0.05 $N\ m^{-2}$, from 15 to 60% for a Monin-Obukhov stability of ± 0.05, and from 25 to 100% for a roughness length of 2×10^{-4} m. (51 refs.)

121315 Factors influencing the marine boundary layer during a cold-air outbreak. S.A.Stage (Dept. of Meteorology, Florida State Univ., Tallahassee, FL, USA).
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.269-87 (July 1983).
The model for the cloud-topped marine boundary layer during a cold air outbreak developed by Stage and Businger (1981) is used in conjunction with a test profile based on a fall outbreak episode over Lake Ontario to study factors influencing marine boundary-layer evolution. Sensitivity tests are done which show changes in layer evolution resulting from variation of wind speed radiative sky temperature, water surface temperature, humidity of the shoreline sounding and divergence. The behavior of the layer in the presence of a region of cold-water upwelling near the shore is also investigated. It is found that the main effect of the upwelling region is to delay modification of the boundary-layer air. (10 refs.)

121316 Similarity functions in the tropical marine boundary layer. G.K.Greenhut (NOAA Environmental Res. Labs., Boulder, CO, USA), R.R.Brook.
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.289-303 (July 1983).
Mean profiles of virtual potential temperature, specific humidity, and the wind velocity components are obtained from aircraft data taken during the NORPAX trans-equatorial shuttle over the Pacific Ocean. The resulting parameters are used to calculate the similarity functions A, B, C, and D. These agree well with similarity functions obtained for the tropical Atlantic Ocean using GATE data (Fitzjarrald and Garstang, 1981). The similarity function A for wind speed over the tropical oceans is in good agreement with values obtained over land at higher latitudes. the tropical temperature and humidity functions, C and D, are lower than those obtained at higher latitudes, becoming negative as $h/(-L) \to 0$. (27 refs.)

121317 The canopy coupling index of a tropical forest. R.T.Pinker (Dept. of Meteorology, Univ. of Maryland, College Park, MD, USA).
Boundary-Layer Meteorol. (Netherlands), vol.26, no.3, p.305-11 (July 1983).
During the TREND (Tropical Environmental Data) experiment conducted in Thailand wind observations were made at several levels below and above a tropical forest canopy. These data were used to compute the widely used canopy coupling index and to study its dependence on ambient conditions. The results indicate that the coupling between the above and below canopy flows depends primarily on stability and wind direction and to a lesser extent on the magnitude of the ambient wind speed. The coupling index as a function of the normalized height below the canopy was best described by exponential functions. (6 refs.)

121318 An initial assessment of pollutant dispersion by sea breezes in the Latrobe Valley. W.L.Physick (CSIRO Div. of Atmospheric Phys., Mordialloc, Australia).
Clean Air (Australia), vol.17, no.2, p.24-8 (May 1983).
The role of the sea breeze in the dispersion of pollutants has been studied in a number of localities. In this paper, the surface climatology of the Latrobe Valley sea breeze is combined with aspects of those studies to identify areas in the Valley which are likely to be affected most by sea-breeze dispersion. With the current distribution of emitters, it appears the arrival of the sea breeze may improve the air quality in all regions, although on occasions it may transport emissions to the upper part of the Valley beyond Yallourn. Details of a possible field study to further examine the ideas of this paper are presented. (12 refs.)

121319 Steady, periodic and aperiodic solutions of atmospheric flows. B.Legras (Lab. de Meteorologie Dynamique, Paris, France), M.Ghil.
J. Mec. Theor. & Appl. (France), spec, suppl., p.45-82 (1983). In French.
The authors consider the barotropic potential vorticity equation on the sphere with simplified topography spectrally truncated to 25 components. The resulting dynamical system is studied as a function of a forcing and a dissipation parameter. Stationary, periodic and aperiodic solutions are obtained which exhibit some analogies with zonal and blocked atmospheric flow regimes. The bifurcations of stationary solutions in phase space are explored systematically by a continuation method. Periodic and aperiodic regimes are studied by numerical integration of the time-dependent equations. Persistence of the different regimes and transitions between regimes are also discussed. (27 refs.)

121320 On the relevance of two-dimensional turbulence to geophysical fluid motions. J.C.McWilliams (Nat. Center for Atmospheric Res., Boulder, CO, USA).
J. Mec. Theor. & Appl. (France), spec, suppl., p.83-97 (1983).
Comparisons are made between the theory of two-dimensional turbulence and certain observed characteristics of oceanic and atmospheric flow. In practice, several generalizations of strictly two-dimensional turbulence are needed to obtain more similarities in the comparisons. These include a finite radius of deformation (γ-turbulence), nonlinear interactions between different vertical modes (baroclinic turbulence), a wave propagation mechanism (β-turbulence), variable topography and a background mean circulation (jet turbulence). Collectively, these generalizations are known as geostrophic turbulence. The observed phenomena to which comparisons are made include weather impredictability, spectrum peaks and power law regimes in horizontal and vertical wavenumber spectra, particle dispersion rates, flow near topography, and aspects of the energy budget for geophysical turbulence. (46 refs.)

121321 Some singularities and irregularities in the seasonal progression of the 700 mb height field. J.R.Lanzante (Dept. of Meteorology & Phys. Oceanography, Rutgers State Univ. of New Jersey, New Brunswick, NJ, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.967-81 (June 1983).
A climatological investigation of singularities in the seasonal progression of 5-day means of 700 mb height was undertaken for the region 30-90°N, from 160°E eastward to 0°, for the period 1947-76. A harmonic analysis is performed at each of the 127 gridpoints (10° longitude by 10° latitude spacing) in order to determine the field of deviations (for each 5-day period) between the long-term mean value and the first harmonic value (which represents the smooth seasonal progression of heights). The student's t-test is applied at each gridpoint to test whether the long-term (population) mean is significantly different from the first harmonic value. The significance of the field of t-statistics for each 5-day period is estimated. The results of the analyses described above indicate that the 700 mb height field deviates significantly from the first harmonic during several times of the year. (17 refs.)

121322 The relationship between the surface wind field and convective precipitation over the St. Louis area. G.L.Achtemeier (State Water Survey Div., Illinois Dept. of Energy & Natural Resources, Champaign, IL, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.982-99 (June 1983).
Rainfall, wind and temperature data at the surface for a mesoscale area surrounding St. Louis, Missouri for seven summer days in 1975 are used to determine qualitative and quantitative relationships between divergence, and the location, timing and intensity of rainfall. The study uses 30 prominent raincells that formed over a 1600 km^2 wind network under different synoptic and subsynoptic weather conditions. The results indicate that the physical relationships between convergence and convective rainfall over the Middle West are quite complex. Widespread convective rainfall seldom occurred in the absence of some large scale forcing. Possible forcing mechanism occurred at various levels within the troposphere and over several different space scales. On the cell scale, convergence preceded some raincells but not others. Potential mechanisms that could explain the dichotomy are investigated. (12 refs.)

121323 Specification of monthly precipitation in the western United States for monthly mean circulation. B.C.Weare, M.A.Hoeschele (Dept. of Land, Air & Water Resources, Univ. of California, Davis, CA, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1000-7 (June 1983).
The ability to specify monthly precipitation at 36 stations in Washington, Oregon and California by various indices of monthly mean circulation is investigated. Most of the circulation indices are derived from eigenvector analyses of 700 mb geopotential height or relative vorticity for 1951-76 or 300 mb relative vorticity for 1963-76. The results indicate that an average up to 60% of the rainfall variance may be specified by same-month average circulation parameters. The 700 mb parameters analyzed within a limited domain in the vicinity of the rainfall network result in the best specification ability. Indices derived from larger domains or from the 300 mb vorticities in generally poorer specifications. (16 refs.)

121324 Hailstone growth trajectories in the dynamic evolution of a moderate hailstorm. J.-C.Grenier, P.Admirat, S.Zair (Lab. de Glaciologie, Grenoble, France).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1008-21 (June 1983).
For the purpose of studying the growth environment of hailstones in a moderate storm, more than 200 hailstones, collected at several points along the storm path, were investigated by crystallographic and isotopic analysis. The majority of the embryos were frozen drops. The post-embryonic growth, generally observed in two growth layers, took place in a narrow range of altitudes. For six hailstones this range, inferred from isotopic data supported by a model accounting for entrainment, was between 5900 and 7100 m (−11 to −19°C). The hailstone growth trajectories are in good agreement, in space and in time, with the cell dynamic evolution derived from radar data. (21 refs.)

121325 Visual cloud histories related to first radar echo formation in northeast Colorado cumulus. C.A.Knight, W.D.Hall, P.M.Roskowski (Nat. Center for Atmospheric Res., Boulder, CO, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1022-40 (June 1983).
Using quantitative analysis of time-lapse motion pictures from aircraft and a sensitive meteorological radar, the cloud top history is related to the early radar echo development in 12 vigorous, summer, convective cloud turrets in northeastern Colorado. At a threshold of about 5 dB(Z), the first echoes appear typically 5-10 min after the cloud top passes the −20°C level. The first echo either appears at cloud top or reaches the top very quickly. It sometimes appears at a well-defined height, but sometimes nearly simultaneously over an altitude range of 3 km or more. Radar echo at 5 dB(Z) typically fills the visual cloud 5-10 min after first echo. A detailed model of the rates of ice particle formation by vapor growth followed by riming gives a 5 dB(Z) radar echo within 7-10 min at concentrations as low as 1 m^{-3}, at most temperatures between −10 and −20°C and in cloud conditions realistic for northeast Colorado. The natural echo development may often result from the transport of embryonic ice particles into regions with vigorous updraft and high liquid water content where growth by accretion is rapid. (55 refs.)

121326 Heavy thunderstorms observed over land by the Nimbus 7 scanning multichannel microwave radiometer. R.W.Spencer (Space Sci. & Engng. Center, Univ. of Wisconsin, Madison, WI, USA), W.S.Olson, Wu.Rongzhang, D.W.Martin, J.A.Weinman, D.A.Santek.
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1041-6 (June 1983).
In an examination of microwave data from the Nimbus 7 satellite, brightness temperatures are found that are much lower than those expected for the radiation emanating from rain-producing clouds. Every case of very cold brightness temperature coincides with heavy thunderstorm rainfall. The cold temperatures can be attributed to scattering by a layer of ice hydrometeors in the upper parts of the storms. Thus it appears that brightness temperatures observed by satellite microwave radiometers can at times distinguish heavy rain over land. (23 refs.)

121327 Diurnal radiance patterns of finite and semi-infinite clouds in observations of cloud fields. D.M.Ebel, T.B.McKee (Dept. of Atmospheric Sci., Colorado State Univ., Fort Collins, CO, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1056-64 (June 1983).
One of the important radiative effects of cloud shape is to modify diurnal radiance patterns observed from satellites. Theory predicts a diurnal radiance pattern nearly symmetric about local noon for both semi-infinite and finite clouds situated on the equator at the equinox with a satellite directly overhead. For a geostationary satellite (SMS-1) located to the west of the cloud, the semi-infinite cloud still predicts a pattern nearly symmetric about local noon while finite cubic clouds produce a distinctly different pattern which peaks during the afternoon. Simulated diurnal satellite observations of a finite cubic and semi-infinite cloud are compared with actual diurnal satellite observations of cloud fields with cloud cover varying from less than 30% to greater than 90%. (23 refs.)

121328 Bulk parameterization of the snow field in a cloud model. Yuh-Lang Lin, R.D.Farley, H.D.Orville (Inst. of Atmospheric Sci., South Dakota School of Mines & Technol., Rapid City, SD, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1065-92 (June 1983).
A two-dimensional, time-dependent cloud model is used to simulate a moderate intensity thunderstorm for the High Plains region. Six forms of water substance (water vapor, cloud water, cloud ice, rain, snow and hail, i.e. graupel) are simulated. The model utilizes the 'bulk water' microphysical parameterization technique to represent the precipitation fields. Accretion processes involving the various forms of liquid and solid hydrometeors are simulated. The transformation of cloud ice to snow through autoconversion (aggregation) and Bergeron processes and subsequent accretional growth or aggregation to form hail are simulated. Hail is also produced by various contact mechanisms and via probabilistic freezing of raindrops. Evaporation (sublimation) is considered for all precipitation particles outside the cloud. The melting of hail and snow are included in the model. Wet and dry growth of hail and shedding of rain from hail are simulated. The formation of virga from cloud anvils is modeled. (62 refs.)

121329 On the evaluation of wind power from short wind records. V.R.Barros, E.A.Estevan (Centro Nacional Patagonico, Consejo Nacional de Investigaciones Cientificas y Tecnicas, Chubut, Argentina).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1116-23 (June 1983).
A method to estimate the meteorological mean wind power of a given site and year based upon data of only three months is presented. It is based on the minimization of the rms errors between observations and a representation by means of empirical orthogonal functions. These functions are calculated from a matrix formed by annual series of wind speed data from stations belonging to the same region. A numerical experiment is performed using wind series of 20 stations in the US Midwest and East. The method allows the recovery of both the mean wind speed value and its variance in a small error. The meteorological mean wind power of the year is calculated using the Weibull-II and Rayleigh probability distributions. Using the Weibull-II distribution, the method outlined above, and only 13-week observations, estimations of the true meteorological wind power is obtained. (13 refs.)

121330 A comparison of computed and observed insolation under clear skies over the Pacific Ocean. R.K.Reed (Pacific Marine Environmental Lab., NOAA, Seattle, WA, USA), R.E.Brainard.
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1125-8 (June 1983).
In an effort to verify computational methods for ocean heat budgets, observations of insolation under clear skies for 26 days are compared with values computed by a formula previously derived from the Smithsonian Tables. The agreement between the observations and formula is within 2.0% for three groups of data over the Pacific between 10°S and 47°N. Random and systematic errors in the formula appear to be insignificant in these regions, but its validity is uncertain at higher latitudes. (9 refs.)

121331 Two-parameter empirical model for rainfall rate distribution. F.Moupfouma (CNET, Issy-les-Moulineaux, France).
Electron. Lett. (GB), vol.19, no.19, p.800-1 (15 Sept. 1983).
In a previous paper (see ibid., vol.18, p.460-1, 1982) the author suggested a three-parameter model providing a good fit for rate distribution. Moreover, this model approximates a log-normal distribution at low rates and a gamma distribution at high rates. In the letter the author reduced the number of parameters to two by setting the third one constant. This modified model appears to give good agreement with the experimental data gathered in various locations around the world. (8 refs.)

121332 Methods for forward uplink depolarization control in satellite link earth stations. M.Nouri, M.R.Braine.

GEC J. Res. Incorp. Marconi Rev. (GB), vol.1, no.1, p.59-71 (1983).

In broadcasting and fixed satellite services with point-to-multipoint or multipoint-to-point modes of operation and employing frequency re-use, it may be technically and economically advantageous to use forward uplink depolarization cancellation as a means of minimizing depolarization interference due to precipitation. A number of methods for achieving cancellation adaptively, using control devices in the feed assembly or in an auxiliary path branched from the main transmit path, have been analysed. Their performance has been evaluated under exacting conditions of open loop control and their merits are compared. All methods exhibit two degrees of freedom and as such are potentially capable of perfect uplink depolarization control for a single polarization under all prevailing atmospheric conditions. Bounds on permissible overall depolarization control error in practical implementation are also included. (18 refs.)

121333 Acetonitrile in the atmosphere. G.Brasseur, E.Arijs, A.De Rudder, D.Nevejans, J.Ingels (Belgian Inst. for Space Aeronomy, Brussels, Belgium).

Geophys. Res. Lett. (USA), vol.10, no.8, p.725-8 (1983).

The vertical distribution of acetonitrile between 0 and 55 km altitude is calculated assuming that CH_3CN is released at the Earth's surface and that the main loss process in the stratosphere is the reaction with hydroxyl radicals. The influence of different possible surface concentrations is investigated. The role of the destruction of CH_3CN by Cl, as well as the use of different eddy diffusion coefficients is briefly discussed. The results are compared with recent measurements of acetonitrile. (25 refs.)

121334 A re-evaluation of laser heterodyne radiometer ClO measurements. R.T.Menzies (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.8, p.729-32 (1983).

Previously reported measurements of stratospheric ClO using a balloon-borne laser heterodyne radiometer, launched from Palestine, Texas, are re-evaluated as a result of recent spectroscopic data. A spectral feature which was observed during September 1978 and November 1979 flights was incorrectly identified as a ClO absorption line, while a second feature observed during the latter flight with somewhat limited sensitivity is now believed to be due to ClO. This new interpretation results in a measured ClO profile which falls off more rapidly with decreasing altitude than the previous results indicated. (19 refs.)

121335 Large amplitude middle atmospheric electric fields: fact or fiction?. M.C.Kelley, C.L.Siefring, R.F.Pfaff (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).

Geophys. Res. Lett. (USA), vol.10, no.8, p.733-6 (1983).

Measurements of large apparent DC electric fields ($\sim$V/m) in the middle atmosphere made by two sounding rockets are carefully analyzed and shown to be spurious. This may shed some doubt on recent measurements of large DC electric fields by other experimenters. Evidence is presented, for one rocket, indicating that the measured electric fields are aligned with the velocity vector of the rocket. This suggests the possibility that the measured electric fields are due to a negatively charged wake. A comparison of measurements made by different electric field booms is also presented. It is seen that in one experiment insulating coatings on the booms may have affected results. It is the authors' opinion that insulating coatings should not be used at mesospheric altitudes because of possible detrimental effects such as frictional charging. (16 refs.)

121336 Continuous mode in the theory of the barotropic instability of zonal flows. M.Yamada (Dept. of Phys., Kyoto Univ., Kyoto, Japan), K.Gotoh.

J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3039-46 (Sept. 1983).

Evolution of the two-dimensional small disturbance superimposed on a viscous parallel shear flow is investigated under the beta-plane approximation of revolution. Formal solution is obtained for an arbitrarily localized initial distribution of vorticity. The eigenfunctions of the normal mode are proved to compose a complete set. In the region where the basic flow is uniform the eigenfunction of the continuous mode behaves as the Rossby wave. The interaction between the shear and the Rossby wave is found to be an inherent character of the eigenfunction of the continuous mode. The properties of the critical latitude of the Rossby wave are attributable to those of the friction layer in the eigenfunction.

121337 Kinematics and correlation of the surface wind field in the South Atlantic Bight. R.H.Weisberg, L.J.Pietrafesa (Dept. of Marine, Earth & Atmospheric Sci., North Carolina State Univ., Raleigh, NC, USA).

J. Geophys. Res. (USA), vol.88, no.C8, p.4593-610 (30 May 1983). [received: Oct. 1983]

Surface winds observed at Charleston, South Carolina, and at an offshore buoy located some 300 km to the east of Charleston are analyzed to determine operational transformations for estimating the offshore winds from the coastal winds. Both the statistics describing the wind field at each station along with those describing the correlation between stations are found to be seasonally modulated. Ensemble averaged (by season) transfer functions computed by using the first 3 years of available data are applied to a fourth independent data year for assessing their predictive utility. The transfer functions and predictability are both seasonally modulated and the transformation matrix is nondiagonal (each offshore wind velocity component depends upon both costal components). (16 refs.)

121338 A study of structure at typhoon approach based on data on observation point—which has a purpose to construct a forecasting system of wind disaster. K.Kariya (Dept. of Electricity, Ritsumeikan Univ., Kyoto, Japan), M.Furuichi.

Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.40, p.35-56 (1981).

The future wind speed probability density distribution may be estimated or predicted from the transitions of the wind speed probability density distributions measured hourly as the typhoon approaches the observation point shows how the disaster forecast preventing the damages caused by the repetitions of the near gales and the gusts may be done. A practical approach to the study of the transitional measurement method of probability density distribution is presented. An atmospheric pressure distribution model and a wind speed distribution model of the typhoon are discussed. (18 refs.)

121339 Microwave spectroscopy of H_2O in the stratosphere and mesosphere. P.R.Schwartz (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington DC, USA), C.L.Croskey, R.M.Bevilacqua, J.J.Olivero.

Nature (GB), vol.305, no.5932, p.294-5 (22 Sept. 1983).

Ground-based microwave spectroscopy is a powerful technique for remote sensing of minor constituents, such as H_2O, in the middle atmosphere that might otherwise be difficult to measure quantitatively. The 6_{16}-$5_{23}H_2O$ transition at 22.2 GHz is particularly well suited for this application. Monitoring of the H_2O altitude profile on short and long time scales is practical and has been going on from Haystack Observatory for several years. The principal limitation of this experiment is not receiver sensitivity but, rather, baseline curvature in the receiver-spectrometer system. Baseline effects have limited the effective bandwidth of the Haystack experiments to 6.67 MHz making the effective lower altitude limit of profile inversion $\sim$50 km. They are also a dominant source of error in recovered profiles in the 50-60 km range. The authors present the first results of observations with a new receiver system developed specifically to observe atmospheric H_2O which allowed a spectrometer bandwidth of 40 MHz to be used and, thus, allowed the H_2O profile from $\sim$35 to 80 km to be recovered. (7 refs.)

121340 Chemical budgets of the stratosphere. P.J.Crutzen, U.Schmailzl (Air Chem. Div., Max-Planck-Inst. for Chem., Mainz, Germany).

Planet. & Space Sci. (GB), vol.31, no.9, p.1009-32 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).

A review is given of the stratospheric budgets of odd oxygen, odd nitrogen, nitrous oxide, methane and carbonyl sulfide. The stratospheric column production rate of NO by the reaction of $N_2O+O(^1D)=2NO$ is $1.1\text{-}1.9\times10^8$ molecules cm^{-2} s^{-1}. The stratospheric loss rates for N_2O, CH_4 and COS are equal to $0.9\text{-}1.4\times10^9$, 1×10^{10} and 0.5×10^7 molecules cm^{-2} s^{-1}, respectively. It is shown that photochemical models and available ozone observations cannot be reconciled and that there may be particularly severe problems in the 25-35 km region. Volcanic emissions of SO_2 to the stratosphere may locally lead to much enhanced ozone concentrations and heating rates. (135 refs.)

121341 The ozone budget in the stratosphere: results of a one-dimensional photochemical model. D.Cariolle (Centre Nat. de Recherches Meteorologiques, Toulouse, France).

Planet. & Space Sci. (GB), vol.31, no.9, p.1033-52 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).

The ozone concentration in the stratosphere results from the combined action of various catalytic cycles involving nitrogen oxides, HO_x and Cl_x radicals, as well as from transport processes. The results of a one-dimensional model allow the relative efficiency of those cycles to be evaluated as a function of altitude. It is found that, in the upper stratosphere, the ozone budget can be established in a straightforward manner, whereas in the lower stratosphere, chemical couplings are more complex and transport processes increasingly important. The model evaluations of the impact of chlorofluorocarbon release and nitrous oxide and methane increase on the ozone layer are also presented. (29 refs.)

121342 Ozone varability. H.U.Dutsch (Lab. for Atmospheric Phys., ETH, Zurich, Switzerland).

Planet. & Space Sci. (GB), vol.31, no.9, p.1053-64 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).

The data base for the ozone total amount and the vertical distribution is considered. On examination it becomes evident that the analysis of the global data set of relatively short duration must be combined with that of single stations with long series. The ozone content at different levels in the stratosphere is influenced by circulation patterns on different scales and thus gives different types of information. A solar cycle influence by circulation patterns on different scales and thus gives different types of information. A solar cycle influence on the ozone content in the upper stratosphere seems—if the contribution of volcanic disturbance is also taken into consideration—compatible with the observational series at Arosa. (12 refs.)

121343 Atmospheric composition: influence of biology. M.B.McElroy (Center for Earth & Planetary Phys., Harvard Univ., Cambridge, MA, USA).

Planet. & Space Sci. (GB), vol.31, no.9, p.1065-74 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).

The composition of the atmosphere is regulated by biological activity on a variety of time scales. Global biogeochemical cycles of nitrogen, carbon and sulfur are discussed with an emphasis on N_2O, NO, CO_2, CH_4, and SO_2. It is argued that Man is a major influence on the budget of these gases. His influence is attributed primarily to use of fossil fuels, to various aspects of agriculture and to the disposal of human and animal waste. (61 refs.)

121344 Influence of peroxyacetyl nitrate (PAN) on odd nitrogen in the troposphere and lower stratosphere. A.C.Aikin, J.R.Herman, E.J.R.Maier, C.J.McQuillan (Lab. for Planetary Atmospheres, NASA/Goddard Space Flight Center, Greenbelt, MD, USA).

Planet. & Space Sci. (GB), vol.31, no.9, p.1075-82 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).

Nonmethane hydrocarbon breakdown in the atmosphere produces aldehydes of which a fraction are transferred into PAN in the presence of NO and NO_2. Since ethane is destroyed photochemically primarily above 1 km, PAN can be introduced into the upper troposphere and lower stratosphere without the need to be transported from the boundary layer. At mid-latitudes the concentration of PAN below 20 km is 0.1 ppb comprable to and in some instances larger than predicted HO_2NO_2 mixing ratios. Like HO_2NO_2 and HNO_3, PAN serves as a reservoir for odd nitrogen. (41 refs.)

121345 Scattering by Pruppacher-Pitter raindrops at 30GHz. C.Yeh (Electrical Engng. Dept., Univ. of California, Los Angeles, CA, UDA), R.Woo, J.W.Armstrong, A.Ishimaru.

Radio Sci. (USA), vol.17, no.4, p.757-65 (July-Aug. 1982). [received: Oct. 1983]

Optimum design of modern ground-satellite communication systems requires knowledge of rain-induced differential attenuation, differential phase shift and cross-polarization factors. After a comprehensive assessment of different available analytical techniques, an efficient technique is chosen to yield the desired scattering results. A tabulation of the scattered fields for Pruppacher-Pitter raindrops with sizes ranging from 0.25 mm to 3.5 mm at 20°C and at 30 GHz for several incidence singles is given. (20 refs.)

121346 Remote sensing of atmospheric waves in O_2 and H_2O microwave emissions. M.El-Raey (Dept. of Phys. & Postgraduate Res. Center, Univ. of Alexandria, Alexandria, Egypt).

Radio Sci. (USA), vol.17, no.4, p.766-72 (July-Aug. 1982). [received: Oct. 1983]

Atmospheric microwave emissions from oxygen near 58.0, 54.0 and 51.0 GHz and water vapor at 22.235 GHz are monitored simultaneously at a time interval of 10 s. Power spectral analysis of radiometer output indicated frequent occurrence of enhanced emissions at periods between 3 and 13 m in. These are attributed to local buoyancy Brunt-Vaisal oscillations. Inversion of integrated brightness temperatures makes it possible to sense temperature profiles and natural wave simultaneously. Spectral analysis of microwave and/or infrared emissions, as monitored by a geostationary satellite-borne radiometer may reveal relationships between temperature profiles and natural oscillations in the Earth's atmosphere over a wide height range. (34 refs.)

121347 Analysis of rain clutter data from a frequency agile radar. W.B.Gordon (Radar Div., Naval Res. Lab., Washington, DC, USA).
Radio Sci. (USA), vol.17, no.4, p.801-16 (July-Aug. 1982). [received: Oct. 1983]
Measurements of rain clutter taken with a frequency agile *S* band radar for the purpose of studying the Doppler power spectra and the variation of backscattered power with space, time, and frequency. The clutter was found to be nonhomogeneously distributed in both space and time, but the mean backscattered power versus frequency relation seemed to involve only a single parameter having a spatial and temporal variation. A significant portion of the backscattered signal energy was always found to lie in the negative frequency range and the Doppler power spectra were sometimes found to have multiple peaks at both positive and negative Doppler frequencies. (9 refs.)

121348 Spectral parameter estimation of CAT radar echoes in the presence of fading clutter. T.Sato, R.F.Woodman (Arecibo Obs., Arecibo, Puerto Rico).
Radio Sci. (USA), vol.17, no.4, p.817-26 (July-Aug. 1982). [received: Oct. 1983]
The 430 MHz, 2 MW radar at the Arecibo Observatory is currently being used as a stratospheric-tropospheric radar. A parameter estimation technique that parameterizes the first three spectral moments corresponding to the desired stratospheric signals as well as a few Taylor series coefficients of the auto-correlation function of the clutter is presented. The three first moments can be obtained in this manner even in the presence of clutter 50 db stronger. A sequence of fine altitude and high temporal reolution wind profiles is presented, showing the potential of the instrumental and technique for the study of stratospheric dynamics. (7 refs.)

121349 Comparison of winter-nocturnal geostationary satellite infrared-surface temperature with shelter-height temperature in Florida. E.Chen, L.H.Allen,Jr., J.F.Bartholic, J.F.Gerber (Fruit Crops Dept., Univ. of Florida, Gainesville, FL, USA).
Remote Sensing Environ. (USA), vol.13, no.4, p.313-27 (Sept. 1983).
Geostationary satellite surface temperatures derived from the Visible and Infrared Spin Scan Radiometer (10.5 to 12.6 microns) were compared with 1.5-m air temperatures collected by a thermocouple on a transversing vehicle along rural highway transects in Florida, and with two fixed thermographs located in rural and agricultural areas. Statistical comparisons between satellite and 1.5-m observations yielded a mean correlation coefficient of 0.87 and an average sample standard deviation from regression of 1.57 C° during clear nights for four winters (1978-81). The satellite-temperature image of Lake Okeechobee was compared with its geographic outline for areal image registration. Manual overlays of temporal images were repeatable to within one pixel. Satellite-sensed water temperature of Lake Okeechobee was used as an indicator of satellite radiometer repeatability and stability. (14 refs.)

121350 Structures for the support of antennae. M.A.Nevot.
Rev. Telegr. Electron. (Argentina), vol.71, no.840, p.388-90, 403 (May 1983). In Spanish.
The author states that the design of antennae supports is complicated by the difficulty in forecasting the wind forces which become an important factor with very tall antennae, when analysing faults, and when building antennae in cities where risk factors must be minimised. As a result of an accident to an antenna the author doubts the reliability of certain meteorological records since the height of the antenna may not be the same as the height at which the wind speeds were recorded and since they do not indicate changes in wind speed due to the conformation of the terrain. There is also the problem of sudden gusts and the elasticity of the stay wires. Moreover the sparsity of the meteorological stations and the different methods of recording data suggest that careful revision of the standards on charts is necessary as well as full information on serious disturbances such as tornados. The author then discusses the necessity of a dynamic analysis to determine the vibration, torsion and bending to which the mast may be subjected. There is also the problem of the deterioration of the stay wires and the choice of materials not readily available. In view of these difficulties the author suggests modifications to the meteorological standards in the country. (no refs.) *G.W.*

121351 *N*-nitroso compounds: evidence for their presence in airborne particles. T.J.Kneip, J.M.Daisey, J.J.Solomon, R.J.Hershman (Inst. of Environmental Medicine, New York Univ. Medical Center, New York, NY, USA).
Science (USA), vol.221, no.4615, p.1045-7 (9 Sept. 1983).
Chemical, infrared, and thermal energy analyses have provided evidence for the presence of the N-nitroso functional group in extracts of airborne particles. The total molar N-nitroso concentrations in New York City air are equivalent to the total concentrations of polycyclic aromatic hydrocarbons. Since 90 percent of the N-nitroso compounds that have been tested are carcinogens, the newly discovered but untested materials may represent a significant environmental hazard. (19 refs.)

121352 Multiple electromagnetic wave scattering by disturbances in the inhomogeneous medium covering a caustic during inclined propagation. N.N.Zernov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.26-31 (Aug. 1983). In Russian.
The expression for the complex phase of the field based on Airey representation of the undisturbed field in the vicinity of caustic is obtained and analyzed. (5 refs.)

121353 Rainshadow—the dynamical factor. B.W.Atkinson (Queen Mary Coll. of London, London, England).
Weather (GB), vol.38, no.9, p.264-9 (Sept. 1983).
Orographical precipitation occurs over, and occasionally immediately downwind of, the relief that is its primary cause. The localisation of the precipitation distribution arises from the initiation and/or intensification of the precipitation over high ground and the relative deficit of precipitation on the downwind side. The results of this orographic effect are clearly seen on the mean rainfall map of the United Kingdom. They can also be seen occasionally on maps of precipitation drawn for much smaller time periods, but, as this note aims to show, caution must be exercised in the interpretation of maps of this kind. Clearly, if the effects of uniform frontal uplift and orography are combined, one would expect a large precipitation area (associated with the front) within which heavier precipitation occurred over hills. Conversely, if one were presented with a precipitation map showing strong localisation of precipitation over upland areas, it would be easy to conclude, perhaps erroneously, that only orographical influences had been operating. This article considers such a case by studying rainfall over Wales and southeast England. (9 refs.)

121354 A dust storm over Melbourne. R.S.Lourensz, K.Abe (Bur. of Meteorology, Sydney, Australia).
Weather (GB), vol.38, no.9, p.272-5 (Sept. 1983).
Photographs of a large dust storm over the city of Melbourne, Australia are presented. The photographs span a period of 10 minutes and were taken from the roof of a 27-storey building. The storm occurred at about 3 p.m. on 8th February 1983. The meteorological conditions responsible for the dust storm are described. The storm extended over a distance of 500 km from Mildura in north-west Victoria down to the coast at Melbourne. The visibility, attitude and dust deposition are all described. (no refs.)

121355 Unusual rains in the 1982-83 'dry' season at Khartoum. M.Hulme.
Weather (GB), vol.38, no.9, p.275-6 (Sept. 1983).
For the first time this century a measurable January fall of rain was recorded in Khartoum, the Sudan. The dry season, locally termed shita, had alredy been noticeable for the extremely low temperatures experienced. Night temperatures had on several occasions dropped below 10°C and several days had temperatures no greater than the low 20s Centigrade. 30 January started clear with blue skies but a medium height cloud bank built from the northeast during the day. At 7.30 p.m. local time a light shower was experienced in Khartoum South followed by a further one around 9.00 p.m. Thunder was heard and lightning flashes seen throughout the evening. On the succeeding three days maximum temperatures were about 25°C with humidity much higher than normal at between 50-55 per cent. Significant cloud cover remained for much of the time. Trace rainfalls were recorded on each of the three days, 31 January and 1 and 2 February. (no refs.)

121356 Das $^{18}O/^{16}O$-Verhaltnis im Julicher Niederschlag 1974-1982 und seine Korrelation mit meteorologischen und chemischen Daten (The $^{18}O/^{16}O$ ratio in the precipitation in Julich 1974-1982 and its correlation with meteorological and chemical data). H.Forstel, H.Hutzen.
Report JUL-1854, Kernforschungsanlage, Julich, Germany (June 1983), i+29 pp. In German.
From 1974 to 1982 precipitation in Julich was collected each month. The $^{18}O/^{16}O$-ratio, the pH and the concentrations of calcium, chloride and sulfate were determined. The sampling unit also collected the dry deposition. Correlation studies demonstrate that the $^{18}O/^{16}O$-ratio of precipitation can be an indicator of air temperature. Wind direction, measured near the ground, cannot be used as a tracer for the movements and dynamics of precipitation. The air temperature, possibly as a stimulator of the heating, is correlated with an increased concentration of calcium and sulfate, and a decrease of pH. A precipitation rise only dilutes the amount of ions deposited. The constancy of the $^{18}O/^{16}O$-ratio of precipitation in Julich is confirmed. (12 refs.)

121357 Fundamental limitations caused by RE propagation. R.K.Crance (Thayer School of Engng., Dartmouth Coll., Hanover, NH, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.1/1-19
Atmospheric propagation phenomena affect the design of radio frequency transmission systems. They limit the suitability of portions of the frequency band for some applications, the reliability of system operation, and the density of system occupying each allocated frequency band through the possibility of interference. The suitability, reliability and possibility of interference are considered for frequencies in the range from 1 to 300 GHz. Within this range, the tropospheric processes causing attenuation by gaseous absorption and rain scatter, angle-of-arrival fluctuation, multipath, and ducting by refractive index gradients and scattering by hydrometeors are most important to the questions of suitability, reliability, and interference. (46 refs.)

121358 Medium wave groundwave propagation model—numerical and experimental results. A.F.Fer, A.Hizal (Electrical Engng. Dept., Middle East Tech. Univ., Ankara, Turkey).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.14/1-9
Two computer models incorporating two different groundwave propagation analysis techiques are investigated. The first model is a perturbation techique based on the approach by King, Maley and Wait (1966) and represents an extension of the previous results to take into account an n-section propagation path. The second model is the integral equation solution for irregular and inhomogeneous terrain based on the formulation by Ott (1979). (i.e. PROGRAM WAGNER). The results from the two approaches are compared with each other as well as the results from the Millington (1949) formula for multisection paths and knife edge diffraction for mountainous regions. Limited amount of experimental data is also compared with computed values for ground wave propagation from the Trabzon Broadcast transmitter over the Eastern Anatolian mountain ranges. Computer modelling for the study of ground wave propagation is seen to present an economically advantageous tool in the design of MF communication links. (12 refs.)

121359 A computational model for multiple knife-edge diffraction. L.E.Vogler, P.M.McManamon (Inst. for Telecommunication Sci., US Dept. of Commerce, Boulder, CO, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.15/1-7
The modeling of terrain features has been limited by the difficulties in applying knife-edge diffraction theories to actual path profiles. Previous exact theory accounted for, at most, two knife-edges on a path. In this paper the derivation of a multiple knife-edge attenuation function is described. This exact multiple integral is then transformed into a series suitable for numerical evaluation. The series solution has been implemented as a computer program capable of calculating the attenuation over a path consisting of up to ten knife-edges. A comparison of theoretical attenuation calculations with observed measurements is presented for a 15-km path containing 5 knife-edges. The significance of atmospheric refractivity on multiple knife-edge diffraction is discussed, and a means of using this to provide information about the statistical distribution of propagation loss over specific paths is suggested. (8 refs.)

121360 Multiple diffusion by hydrometers: numerical simulation. N.Spanjaard, J.Lavergnat (CNET/CRPE, Issy-les-Moulineaux, France).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.19/1-6 (6 refs.)

121361 Bistatic radar reflectivities in the range 11-30 GHz. D.G.Charlton, A.R.Holt, B.G.Evans (Dept. of Math., Electrical Engng. Sci., Univ. of Essex, Colchester, England).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.20/1-9
Presents bi-static scattering cross-sections and reflectivities for the scattering of microwaves by raindrops. Compares exact results for spheroids (obtained by the Fredholm integral equation method), with exact results for spheres

(obtained using Mie theory), and approximate calculations for spheroids using Rayleigh theory. Results are given for several frequencies in the range 11-30 GHz, and for both a terrestrial and a satellite path. The Rayleigh approximation is found to give significant errors in certain cases. The results have implications for the calculation of interference between communication systems. (9 refs.)

121362 Overshoot interference on microwave radio links due to the coexistence of multipath fading and trans-horizon propagation. J.E.Doble (British Telecommunications Res. Labs., Martlesham Heath, Ipswich, England).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.21/1-7
Periods of meteorological conditions which lead to multipath effects on line-of-sight systems can also be those during which anomalous trans-horizon propagation is present. The coexistence of these two effects can give rise to increased system sensitivity to overshoot interference from one section of a microwave route into subsequent sections, or into other systems. Current overshoot interference calculations treat these two effects as uncorrelated and the degree to which this assumption is in error has been estimated from independent measurements on transhorizon links (comprising overland, oversea and mixed paths) and terrestrial links terminating in the same area. A method of estimating the probability of outage due to this cause is suggested. It makes use of the CCIR models for multipath fading and transhorizon propagation together with an empirically determined weighting factor of the order of 50 times. (1 ref.)

121363 System aspects of clear air propagation above 40 GHz. D.M.Theobold, J.D.Hopponen (Lockheed Missiles & Space Co., Sunnyvale, CA, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.22/1-9
Communication links operating at frequencies above 40 GHz may be modeled using computer programs which treat both the atmosphere and communication hardware of the system in an integrated fashion. The principle mechanisms to be considered in the clear air mass are absorption by atmospheric gases and turbulence effects. Link degradations due to seasonal variations are treated. Absorption by molecular oxygen and water vapor causes dispersive signal attenuation, phase delay, and noise due to random atmospheric emission. These quantities may be predicted for specific frequency bands and atmospheric conditions by employing a computer program for ray tracing. Examples of the variation of these effects illustrate their complex dependence on atmospheric conditions and ray path elevation angle. The characteristics of the atmospheric transfer function (both amplitude and phase) are of particular importance to questions of modulation distortion in high data rate systems. The atmosphere is viewed as an additional signal filter of the communication channel and the resultant signal distortion is quantified by predicting bit error rate degradation. (4 refs.)

121364 A predictor model for EHF communication satellite system availabilities in the presence of rain. L.M.Schwab, A.J.Simmons (Lincoln Lab., MIT, Lexington, MA, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.25/1-11
A computer-based tool for assessing the effect of rain attenuation upon link availability was developed to aid in selecting fundamental MILSATCOM parameters such as satellite subpoint and operating frequency as well as secondary parameters such as design margin and antenna radiation patterns. (10 refs.)

121365 Diversity reception of COMSTAR 19/29 GHz satellite beacons in convective rain climate of Florida, 1978-1981. D.Davidson, D.D.Tang (GTE Labs. Inc., Waltham, MA, USA), S.C.Bloch.
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.26/1-12
Tampa, Florida (28°N, 82.5°W), has about 90 thunderstorm days per year, nearly all in summer, dominated by events tending to occur in afternoon or early evening. Results of 19-GHz downlink rain-attenuation diversity studies involving site separations of 11, 16 and 20 km and reception at high elevation angle (about 57°), are reported for a period of 29 months, including three rainy seasons. Despite marked month-to-month differences, long-term measurements with the two larger spacings indicates that for separations above about 15 km diversity performance is not sensitive to spacing or orientation. During a fourth rainy season, using a 29-GHz beacon and the 16-km spacing, performance was similar to that predicted by scaling the 19-GHz results of the previous seasons. For rain climates like Tampa's, some form of site diversity will be required for high-reliability SHF satellite links. The diversity data may be helpful in designing schemes for resource-sharing among numbers of TDMA links. (11 refs.)

121366 Long term cross-polar statistics at 12 and 14 GHz on a 30° slant-path. R.G.Howell, J.Thirlwell, D.J.Emerson (British Telecom, Ipswich, England).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.28/1-9
Slant-path propagation measurements relevant to the design of dual-polar satellite systems are reported. The measurements were made using the Orbital Test Satellite (OTS) in conjunction with a 6.1 m off-set Cassegrain aerial located at Martlesham Heath near Ipswich (UK). Co-polar and cross-polar circularly polarised signals at a frequency of 14.5 GHz were transmitted to the satellite. These signals were down-converted to 11.8 GHz and retransmitted to the ground together with an 11.8 GHz circularly polarised beacon signals. In addition measurements were made on an 11.6 GHz linearly polarised telemetry carrier transmitted by the satellite. Cumulative statistics of the cross-polar discrimination (XPD) for the 11.6 and 11.8 GHz signals are presented and the XPD statistics for the 14.5 GHz signal estimated. The statistical significance of the depolarisation produced by high altitude ice crystals is discussed. The relationship $XPD=U-V \log CPR$ proposed by the CCIR to relate XPD to the copolar attenuation (CPA) (dB) for rain is investigated and values for U and V obtained. The dependence of depolarisation on the type of polarisation (linear compared to circular) is studied and compared with theory. (9 refs.)

121367 On combating multipath effects using spread-spectrum systems. C.P.Tou (Dept. of Electrical Engng., Tech. Univ. of Nova Scotia, Halifax, Nova Scotia, Canada).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.36/1-11
Discusses briefly the origins of multipath propagation, their effects on radio communication sysems, and schemes for suppressing these effects. Major attention is given to spread-spectrum schemes to demonstrate their capacity to combat multipath effects, to examine conditions under which the schemes would be effective, and to assess the merits of the schemes. Multipath propagation can occur under various atmospheric and geographic conditions as illustrated by simple examples. The adverse effects of multipath propagation on communication systems can be described in terms of selective fading and intersymbol interference. Simple measures can be found if the multipath propagation is predictable, but sophisticated techniques are required to combat unpredictable multipath interference. (12 refs.)

92.60S Climatology

121368 Climatology of superadiabatic conditions for a rural area. E.S.Takle (Dept. of Agronomy & Earth Sci., Iowa State Univ. of Sci. & Technol., Ames, IA, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1129-32 (June 1983).
Temperature measurements taken over a 6-year period from a 32 m tower are used to study the climatology of low-level superadiabatic conditions in a rural area. Plots of monthly distributions of event commencement times and durations display a high degree of symmetry compared to the distributions for inversions previously published. This climatology can be used to better identify periods when spores, pollens, insects, smoke or agricultural chemical introduced at the surface will quickly become available for long-range transport by the upper level winds. 92.65 ATMOSPHERIC OPTICS

(see also 42.00 Optics)

121369 Seeing for the solar observations on the Terskol Peak. V.I.Troyan, S.N.Osipov.
Astrometriya & Astrofiz. (USSR), no.49, p.67-71 (1983). In Russian.
Seeing for the solar observations on the Terskol Peak in winter time is shown to be 2.7″. The best seeing was observed before midday. (2 refs.)

121370 Scintillation of laser radiation due to propagation through atmospheric turbulence, measurements, and theoretical calculations. C.D.V.Thomas, M.T.Clarke (Royal Armament Res. & Dev. Establ., Sevenoaks, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.557-63 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The scintillation strength may be characterised by the parameter η, $\eta^2=0.5\ Cn^2\ K^{7/6}\ L^{11/6}$, where Cn is the turbulent refractive index constant, K is the wavenumber of the radiation, L is the range. For values of η^2 (in weak scintillation η^2 is the variance of the log irradiance) greater than 0.5, i.e. k for ranges 0.5 km for visible or near IR lasers in summer conditions the scintillation may no longer be described by the weak fluctuation theory. For medium and strong scintillation it is not at present possible to predict either the mean irradiance or the mean square irradiance fluctuations by analytical formulae. However, it is possible to obtain an integral expression for the mean irradiance I. This expression has been evaluated by numerical integration on a 1906A ICL computer. The mean square fluctuation of irradiance is more difficult to calculate, as it involves expressions for the fourth order moment of the field. In this case, it has not yet been possible to even derive closed expressions for the solution of the differential equation for the fourth moment of the field. However a number of possible numerical approaches have yielded results which compare favourably with experimental results in some cases. (4 refs.)

121371 Mauna Loa sky conditions—bench mark and present. C.J.Garcia, E.A.Yasukawa (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.520-6 (Aug. 1983).
Sky conditions at the Mauna Loa Solar Observatory (MLSO) were measured during a period of uncontaminated skies in July 1981, and during the presence of volcanic dust clouds in 1982 using MLSO instrument systems. A six-fold increase in scattering, due to aerosols is accompanied by a 25% direct incident radiation decrease, and sky polarization/intensity perturbations were detected after the onset of volcanic clouds. (8 refs.)

121372 Investigation of the absorption of radiation emitted from a tunable CO_2 laser by water vapor in the range 9-11 μ. V.N.Aref'ev, B.N.Pogadaev, N.I.Sizov (Inst. of Experimental Meteorology, Obninsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.289-92 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.496-502 (March 1983). [received: Oct. 1983]
The results of measurements of the transmission of radiation emitted from a tunable CO_2 laser by the water vapor continuum in the range 9-11 μ are reported. The results for 23 laser lines are used to derive an approximate expression for the calculation of the continuous absorption of radiation by water vapor as a function of its temperature and pressure, as well as a function of the radiation wavelength and the pressure of the broadening gas. It is shown that this expression can be used to calculate the absorption of CO_2 laser radiation propagating in the atmosphere. (22 refs.)

92.90 OTHER TOPICS IN HYDROSPHERIC AND ATMOSPHERIC GEOPHYSICS

121373 Effect of Pleistocene glaciation upon oceanographic characteristics of the North Pacific Ocean and Bering Sea. C.Sancetta (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Deep-Sea Res. Part A (GB), vol.30, no.8A, p.851-69 (Aug. 1983).
During intervals of Pleistocene glaciation, insolation of the high-latitude northern hemisphere was lower than today, particularly during summer. Growth of continental ice sheets resulted in a lowering of sea level by more than 100 m in the Bering Sea. As a result, the Bering Strait was closed and most of the Bering continental shelf exposed. A proposed model predicts that (1) sea-ice formation would occur along the (modern) outer continental shelf, (2) advection would transport the sea ice over the deep basin, and (3) brine would flow into the basin at some intermediate depth to enhance the halocline. The result would be a low-salinity surface layer with a cold, thick halocline and reduced vertical mixing. (42 refs.)

121374 The meteorological product: cloud analysis. R.R.Warner (European Space Operations Centre, Darmstadt, Germany).
ESA Bull. (France), no.35, p.30-3 (Aug. 1983).
The cloud-analysis product is a coded representation of the cloud present in Meteosat thermal infrared and visible images, for a specific time. At present it is produced routinely, four times a day, from images close to the nominal times of 00, 06, 12 and 18 UT, but for internal reasons the results are disseminated to the meteorological community three times daily only. Up to the present time (May 1983) the product has been produced routinely for about a year and users are still in the experimental stage of its utilisation. In concept, however, it was designed principally for use in atmospheric mathematical models and for cloud climatological purposes. Other uses forseen include rainfall studies, radiative-energy-transfer studies and input to synoptic-analysis schemes. (no refs.)

121375 Terrestrial fission xenon: choice of primordial isotopic composition. L.Levsky (Inst. of Precambrian Geology, Acad. of Sci., Leningrad, USSR).
Meteoritics (USA), vol.18, no.2, p.155-8 (30 June 1983).
A new composition of primordial terrestrial xenon is derived, on the assumption that it lies on an extension of the mixing line between solar Xe and anomalous (CCF) Xe in carbonaceous chondrites. With this composition, the apparent fission components in atmospheric and well gas Xe become larger, and resemble ^{244}Pu fission xenon. (7 refs.)

121376 The young Sun and the atmosphere and photochemistry of the early Earth. V.M.Canuto (NASA, Goddard Inst. for Space Studies, New York, NY, USA), J.S.Levine, T.R.Augustsson, C.L.Imhoff, M.S.Giampapa.
Nature (GB), vol.305, no.5932, p.281-6 (22 Sept. 1983).
The origin and evolution of the Earth's early atmosphere depend crucially on the dissipation time t_N of the primitive solar nebula, SN. Using different theories of turbulence, the authors estimate that for a 0.1 $M_\odot$ SN, t_N is 2.5-8.3 Myr. Because accretion times are usually much longer, the authors conclude that most planetary accretion must have occurred in a gas-free environment. Using new IUE data, a wavelength-dependent UV flux is constructed for the young Sun which is then used to study the photochemistry and concentrations of O, O_2, O_3, OH, H, HCO and formaldehyde H_2CO in the Earth's early prebiological atmosphere. (61 refs.)

121377 On the effect of interstellar gas on atmospheric oxygen and terrestrial life. S.Yabushita, A.J.Allen (Dept. of Appl. Math., Kyoto Univ., Kyoto, Japan).
Observatory (GB), vol.103, no.1056, p.249-51 (Oct. 1983).
The disappearance of most of the very large species at the end of the Cretaceous period has led to much speculation concerning cataclysmic events which may have made the Earth uninhabitable for them. Against this are set slow, or evolutionary, processes which may allow other species to become better adapted to survival. The authors present a model which is moderately slow and causes a permanent change in the Earth's biosphere, yet is global and cataclysmic. Following McCrea (1975) and Begelman and Rees (1976), the authors treat the effect of an interstellar hydrogen cloud on the Earth, and propose that a rare passage through a dense cloud may have depleted the atmosphere's oxygen sufficiently that certain species ceased to be viable. (11 refs.)

121378 Proceedings of the 26th Conference on Great Lakes Research (papers in summary form only received).
Buffalo, NY, USA: Int. Assoc. Great Lakes Res. (1983), ix+49 pp.
Conference held at: Oswego, NY, USA. Date 23-27 May 1983. Various aspects of the Great Lakes of North America were discussed at this conference. The lakes discussed include Huron, Ontario, Erie, Michigan, Owasco, Superior, Champlain and the inland lakes of New York State. The tropics discussed include sedimentation, pollution, water quality, biological aspects, ice and climatology, fisheries and wildlife and recreational uses.

93.85 INSTRUMENTATION AND TECHNIQUES FOR GEOPHYSICAL RESEARCH

121379 γ-ray spectrometric determination of uranium-series nuclides in marine phosphorites. Kee Hyun Kim, W.C.Burnett (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
Anal. Chem. (USA), vol.55, no.11, p.1796-800 (Sept. 1983).
A series of nondestructive γ-ray spectrometry measurements, utilizing a well-type intrinsic germanium detector, has been used to determine activities of uranium-series radionuclides in marine phosphate nodules. Two low-energy γ-ray photopeaks were used for measuring ^{238}U, three or four peaks for ^{226}Ra, and one low-energy peak for ^{210}Pb. The system was calibrated for efficiency by using both natural and synthetic calibrated standards. Agreement between the authors' γ-ray method and standard radiochemical techniques is shown to be satisfactory based on intercomparisons with previously analyzed samples and standards. The authors' results indicate that a nondestructive γ spectrometric method can often replace the more time-consuming and elaborate radiochemical techniques traditionally used in measuring low-level radioactivities in natural samples. (35 refs.)

121380 A long-range atmospheric tracer field test. M.M.Fowler (Los Alamos Nat. Lab., Los Alamos, NM, USA), S.Barr.
Atmos. Environ. (GB), vol.17, no.9, p.1677-85 (1983).
A long-range application of a heavy methane atmospheric tracer system has been carried out using both $^{12}CD_4$ and $^{13}CD_4$. The experiment had several objectives including testing a newly developed cryogenic air sampler testing a new sample handling apparatus and demonstrating the use of heavy methanes over transport distances up to 2500 km and travel times of more than 100 h. A simple diffusion estimation method applied in conjunction with trajectories produced by NOAA from upper air meteorological data yields good agreement with the tracer data on dosage and arrival time. The duration of observed tracer at the long-range stations was longer than estimated with simple concepts. (9 refs.)

121381 Vertical ozone profiles determined from satellite METEOR spectrometer measurements. U.Feister (Meteorologisches Hauptobs., Potsdam, Germany).
Z. Meteorol. (Germany), vol.33, no.4, p.197-217 (1983).
The vertical distribution of atmospheric ozone in the troposphere and stratosphere has been inferred from observations of the upward directed infrared radiance of the Earth/atmosphere system that have been made using Fourier spectrometers onboard METEOR satellites. Comparing the resulting ozone profiles with ozone profiles measured by balloon-borne ozone sondes, with tentatively removing observational errors of ozone sondes, provides estimates of the information which is contained in the calculated ozone profiles. A gain of information from the remote sensing method under consideration has been found only for the lower stratosphere. As to the information content, similar results have been obtained by applying a regression method that allows to determine vertical ozone profiles from some predictors such as vertical temperature distribution and total ozone. The latter method may be easily handled, and it consumes essentially less computer time as compared to the remote sensing method. (106 refs.)

121382 Use of lasers in hydrometeorological research and for environmental monitoring. V.M.Zakharov, V.S.Portasov, V.U.Khattatov (Central Aerological Obs., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.69-77 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1639-50 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The results of the use of lasers in geological research and for determination of meteorological parameters, atmospheric-aerosol microstructure, and the gaseous composition of the atmosphere are reviewed. (15 refs.)

121383 Digitization noise and accelerograph pen offset associated with Japanese accelerograms. C.B.Crouse, T.Matuschka (ERTEC Inc., Long Beach, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.4, p.1187-96 (Aug. 1983).
Ground-motion accelerograms recorded in Japan between 1956 and 1978 were recently processed. Preprocessing studies of the accelerograms are required that consist of: (1) evaluation of the long-period digitization noise in the accelerograms, and (2) correction for initial offset of the recording pen in the SMAC accelerograph. Long-period digitization noise present in each accelerogram is identified from the Fourier Amplitude Spectrum of the uncorrected accelerogram. Similar investigations with United States accelerograms recorded on 70-mm film revealed that the noise in both sets of data have similar characteristics. Correction for initial pen offset is necessary for some Japanese accelerograms because the pen arm was not parallel to the direction of movement of the recording paper. To account for pen offset, values of the initial pen rotation are assumed, and the accelerograms are corrected using a simple algorithm. (11 refs.)

121384 UHF radar system for airborne surveys of ice thickness. B.B.Narod, G.K.C.Clarke (Dept. of Geophys. & Astron., Univ. of British Columbia, Vancouver, BC, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.7, p.1073-86 (July 1983).
Describes an 840 MHz pulsed radar system developed for airborne sounding of polar glaciers and ice caps. The system performance (ratio of transmitter

power to minimum detectable signal) is 126 dB. A sampling time base converts the received signal to audio frequencies, and data are recorded in analogue form on magnetic tape. Computer-enhanced time sections for a glacier and an ice shelf are presented as examples. (49 refs.)

121385 Remote acoustic classification of marine sediments with application to offshore Newfoundland. N.A.Cochrane (Bedford Inst. of Oceanography, Dartmouth, NS, Canada), A.D.Dunsiger.
Can. J. Earth Sci. (Canada), vol.20, no.7, p.1195-211 (July 1983).
Shallow marine sediments can be remotely classified by the spatial correlation properties of their seismic reflection signatures provided one uses a highly repetitive broadband acoustic source. A classification scheme defined by three spatial coherence parameters is shown capable of automatically differentiating between several formations of unconsolidated sediments in a limited area of offshore Newfoundland. The consistency and generality of the technique are explored and comparisons with standard echogram interpretation are made. (16 refs.)

121386 Homomorphic deconvolution of potential field data in one and two dimensions. O.G.Jensen (Lab. in Appl. Geophys., McGill Univ., Montreal, Canada), P.P.Papazis.
Can. J. Earth Sci. (Canada), vol.20, no.8, p.1260-81 (Aug. 1983).
A signal in a non-dispersive reverberant environment can generally be represented as the sum of overlapping delayed replicas of a basic wave form. This convolutional data model has long been employed in seismic analysis and can be usefully extended for the analysis of gravity and magnetic potential field data. The deconvolution of gravity or magnetic data requires the separation of two basic components of the potential fields: one represents a basic irreducible wave form or signature of the potential field, and the other represents the position and scale or distribution of this wave form throughout the area of measurement. (25 refs.)

121387 FANTASIA—a program for target transformation factor analysis to apportion sources in environmental samples. P.K.Hopke, D.J.Alpert, B.A.Roscoe (Inst. for Environmental Studies, Univ. of Illinois, Urbana, IL, USA).
Comput. & Chem. (GB), vol.7, no.3, p.149-55 (1983).
A program for performing *Q*-mode factor analysis of data followed by target transformation factor analysis is described as well as a series of auxiliary programs that help to perform the analysis and to provide estimates of the uncertainties in the results. The operation of these programs is illustrated by an example applying them to a set of well-characterized geological data. (20 refs.)

121388 Improvements in cloud photogrammetry using airborne, side-looking, time-lapse cameras. C.J.Biter, T.W.Cannon, E.L.Crow, C.A.Knight, P.M.Roskowski (Nat. Center for Atmospheric Res., Boulder, CO, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1047-55 (June 1983).
An airborne photographic system, in which the cameras are coupled with an inertial navigation system, was developed and used in a 1978 convective cloud study. Photogrammetric analysis from such a system is enhanced: cloud-feature positions can be determined without external references such as the Earth's horizon or cloud base in the photographs, and the data reduction process can be considerably automated. The authors describe the instrumentation, the photogrammetric theory, and the procedures for obtaining cloud measurements from the photographs. An empirical error analysis based on photographs of terrestrial targets is also presented. (17 refs.)

121389 A practical approach to flux measurements of long duration in the marine atmospheric surface layer. T.V.Blanc (Atmospheric Phys. Branch, Naval Res. Lab., Washington, DC, USA).
J. Clim. & Appl. Meteorol. (USA), vol.22, no.6, p.1093-10 (June 1983).
The practical limitations imposed by the marine environment on the principal flux-measurement methods for experiments requiring more than a few days' duration are examined. Reservations are presented as to the suitability of the bulk method as a primary determination for fluxes and stability. It is suggested that the profile (or gradient) method is more practical. The influence that marine platforms have upon various flux measurements is discussed. It is argued that marine flux measurements should always be accompanied by an auxiliary flux-determination method. The bulk method is recommended as an adjunct to the profile method, since the combination can yield two simultaneous determinations with only a modest increase in experimental effort. The appropriate vertical location of meteorological instrumentation is examined in conjunction with its realistically obtainable measurement accuracies. The practical aspects of employing buoys and marine towers are discussed. An extensive bibliography or marine field experiments, methods and instrumentation is presented. (171 refs.)

121390 Real-time measurement of precipitation using weather radar. D.H.Newsome, G.A.Clift.
Endeavour New Ser. (GB), vol.7, no.3, p.123-32 (1983).
The advent of weather radar making it possible to make almost instantaneous measurements of precipitation over a considerable area opens up very important new prospects for meteorological forecasting. Under the aegis of the European Community, the world's first international weather radar system is being planned, primarily to serve the needs of western Europe. It is expected, however, that techniques and equipment developed by European industry will be widely adopted elsewhere. (10 refs.)

121391 Multi-beam Doppler sonar observation of tidal flow turbulence. R.Lhermitte, H.Poor (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.717-20 (1983).
Preliminary results on tidal flow turbulence acquired from multi-beam Doppler sonar observations are presented. The Doppler sonar is a high resolution system capable of observing the spectrum of radial velocities in the scattering volume with a precision greatly exceeding the Doppler spectrum bandwidth. Such capability provides access to small scale water turbulence observations if foreign contributions to velocity variance are removed. This preliminary analysis of the data is primarily concerned with vertical and horizontal velocity turbulence as related to longitudinal mean flow velocity. (8 refs.)

121392 A fast data recording system for a rotating interferometer. E.C.Tan (Dept. of Electrical Engng., Univ. of Melbourne, Parkville, Victoria, Australia).
Int. J. Electron. (GB), vol.55, no.4, p.653-9 (Oct. 1983).
A fast data recording system has been designed for a special type of radio-wave direction-finder called a rotating interferometer. Its operation is verified and compared with that of the original pen and paper-chart recording system. Its application in ionospheric studies is discussed. (4 refs.)

121393 A method for the determination of absorption for refracted waves. Yu.P.Ampilov, T.I.Oblogina (Geology Faculty, Moscow State Univ., Moscow, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.10 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.10, p.762-9 (1982). [received: Sept. 1983]
A method for determination of absorption characteristics of seismic waves is described. (9 refs.)

121394 The use of Magsat data to determine secular variation. J.C.Cain, J.Frayser, L.Muth, D.Schmitz (US Geological Survey, Denver, CO, USA).
J. Geophys. Res. (USA), vol.88, no.B7, p.5903-10 (10 July 1983).
A combined spatial and secular variation model of the geomagnetic field, labeled M061581, is derived from a section of Magsat data. The SV patterns from this new model are compared with those from the 1980 IGRF and with those for 1970 computed by the DGRF and with the 1960 patterns computed using the GSFC(12/66) model. Most of the features of the M061581 are identical in location and level with those of the 1980 IGRF. Together they confirm that the reversals in sign of field change seen over Asia and North America between 1965 and 1975 are reverting to the pre-1965 states. The M061581 model gives −32 nT/yr for the dipole decay rate, lager than the 70% increase already reported since 1975. This experiment indicates that secular variation can be obtained from satellite data for intervals of less than a full year if corrections can be made for seasonal effects and that 'annual snapshots' of the field by a satellite would allow easy and accurate models of secular change without the use of any surface data. (27 refs.)

121395 A new rock-magnetic approach to selecting sediments for geomagnetic paleointensity studies: application to paleointensity for the last 400 years. J.W.King, S.K.Banerjee, J.Marvin (Dept of Geology & Geophys., Univ. of Minnesota, Minneapolis, MN, USA).
J. Geophys. Res. (USA), vol.88, no.B7, p.5911-21 (10 July 1983).
The hypothesis that the ratio of detrital remanent magnetization to anhysteretic remanent magnetization (DRM/ARM) for sediment samples is a measure of relative geomagnetic paleointensity is critically evaluated by two distinct approaches. One approach is a detailed rock-magnetic examination of the implicit assumptions of the DRM/ARM method and the construction of the selection process by which to identify sediments that conform to requirements satisfying these assumptions. Sediments are 'uniform' with respect to DRM/ARM ratio if they contain magnetite in the 1-15 μm paticle size range as the predominant magnetic mineral and have variations in magnetite content of less than 20-30 times the minimum concentration. The DRM/ARM ratios of these sediments should provide estimates of relative geomagnetic paleointensity. A rock-magnetic evaluation of LeBoeuf Lake sediments with these techniques indicates that these sediments are suitable sediments are suitable for a relative paleointensity study. The second approach to evaluating the DRM/ARM ratio as a measure of relative paleointensity is direct comparison with absolute paleointensity data. A comparison between the LeBoeuf Lake estimates and Thellier-Thellier results from the western United States supports the conclusion that suitable sediments can record geomagnetic paleointensity fluctuations. (35 refs.)

121396 The correction for sediment loading on the seafloor. S.T.Crough (Dept. of Geosci., Purdue Univ., West Lafayette, IN, USA).
J. Geophys. Res. (USA), vol.88, no.B8, p.6449-54 (10 Aug. 1983).
Available measurements of sediment velocity and density indicate that a factor of 600 m s^{-1} of two-way sediment reflection time will correct seafloor depth to yield basement depth in the absence of sediment loading. This simple linear relation is derived from the results of six deep drill holes in abyssal sediments of the North and South Atlantic oceans. The relation predicts the sediment correction with an accuracy of about 50 m, regardless of the lithology sampled, down to a depth of 1.5 s of reflection time. The COST wells on the US continental shelf and empirical relations among velocity, density, porosity, and depth provide estimates of the deeper behaviour of abyssal sediments. (18 refs.)

121397 Stratospheric temperature profile from balloon-borne measurements of the 10.4-μm band of CO_2. C.P.Rinsland (Dept. of Phys., Coll. of William & Mary, Williamsburg, VA, USA), A.Goldman, F.J.Murcray, D.G.Murcray, M.A.H.Smith, R.K.Seals,Jr., J.C.Larsen, P.L.Rinsland.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.327-34 (Oct. 1983).
The technique of nonlinear least squares spectral curve fitting has been used to derive the stratospheric vertical temperature profile from balloon-borne measurements of the 10.4-μm band of CO_2. The spectral data were obtained at sunset with the $\simeq$0.02 cm^{-1} resolution University of Denver interferometer system from a float altitude of 33.5 km near Alamogordo, New Mexico, on 23 March 1981. The r.m.s. deviation between the retrieved temperature profile and correlative radiosonde measurements is 2.2K. (39 refs.)

121398 Theory of radar detection of solitons during ionospheric heating. J.P.Sheering, D.R.Nicholson (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.395-8 (26 Sept. 1983).
RF modifiers at some existing ionospheric heating facilities are found to be sufficiently intense for the production of (collapsing) solitons. Considering the detection of these solitons using Thomson radar, the authors treat the problem of an electromagnetic wave scattering off a collection of collapsing solitons. The cross section for the process is found to be relatively large and an intense plasma-line backscatter is predicted. An explanation of the phenomenon of 'plasma-line overshoot' is suggested. (9 refs.)

121399 Technology for large digital mosaics of Landsat data. A.L.Zobrist, N.A.Bryant, R.G.McLeod (Jet Propulsion Lab., Pasadena, CA, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.9, p.1325-35 (Sept. 1983).
Advances in algorithms and system executive procedures for digital image processing have made digital mosaics of Landsat images (both MSS and RBV) an attractive possibility. The technology developed includes simultaneous map projection and adjustment of frame edges to eliminate both geometric and radiometric seams. The incorporation of ground control points, either by manual or automatic ground control point file identification, has resulted in root-mean-square positional accuracies that exceed 1:100000 scale National Map Accuracy Standards. Rotation to north vertical is accomplished at low computational cost. Input data frames can be cut in any arbitrary shape to remove cloud cover and accommodate terrain offset effects. Two large applications in Pennsylvania and Bolivia are reported. A test case utilizing RBV data is described. (22 refs.)

121400 Detection of bottom features on Seasat synthetic aperture radar imagery. E.S.Kasischke, R.A.Shuchman, D.R.Lyzenga (Radar Div., Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA), G.A.Meadows.
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.9, p.1341-53 (Sept. 1983).
A distinct set of surface patterns detected in imagery collected by the Seasat synthetic aperture radar (SAR) is shown to be the result of an interaction between a physical oceanic process and a bottom topographic feature. These patterns can be used to infer a bottom feature, and thus are a potential source of information for identifying submerged features hazardous to surface navigation. The Seasat SAR imaged bottom-related surface patterns in both deep and shallow water. Examples of these surface patterns are presented with explanations of how they occur. (46 refs.)

121401 Relative measurement of atmospheric pressure with a Digiquartz pressure transducer and a self-registering Fortin barometer (Agari-type). S.Sakakibara, T.Yamada, H.Satake, Z.Fujii, K.Murakami.
Proc. Cosmic-Ray Res. Lab. Nagoya Univ. (Japan), vol.26, no.1, p.13-26 (Feb. 1983). In Japanese.
Describes the Digiquartz pressure transducer and its temperature characteristics. A comparison is made with a Fortin barometer and hysteresis effects are examined. Results of tests over 100 days and field trials on Mt. Norikura at 2770 m over 55 days (1982 October 29-December 22) are presented. (no refs.) *M.J.C.*

121402 Passive microwave sensing of soil moisture content: the effects of soil bulk density and surface roughness. J.R.Wang (Lab. for Atmospheric Sci., NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Remote Sensing Environ. (USA), vol.13, no.4, p.329-44 (Sept. 1983).
Microwave radiometric measurements over bare fields of different surface roughness have been made at frequencies of 1.4 GHz, 5 GHz, and 10.7 GHz to study the frequency dependence, as well as the possible time variation, of surface roughness. An increase in surface roughness was found to increase the brightness temperature of soils. Radiometric time-series observations over a given field indicate that field surface roughness might gradually diminish with time, especially after a rainfall or irrigation. Three years of radiometric measurements over a test site revealed a possible inconsistency in the soil bulk density determination, which is an important factor in the interpretation of radiometric data. (25 refs.)

121403 Estimating surface temperatures from satellite thermal infrared data—a simple formulation for the atmospheric effect. J.C.Price (Hydrology Lab., Plant Physiology Inst., Beltsville, MD, USA).
Remote Sensing Environ. (USA), vol.13, no.4, p.353-61 (Sept. 1983).
Correction of the high spatial resolution satellite data for atmospheric water vapor effects can represent a substantial computational burden unless simplifying assumptions are utilized. A simple formulation is developed and its applicability tested by application to standard meteorological soundings at a time near the overpass of an NOAA operational satellite. It appears that reasonable estimates of surface temperature ($\pm$2-3 C°) are readily obtained for areas of order 100-300 km^2. (16 refs.)

121404 Analysis and design of a differential sunshine recorder. A.Ayensu (Dept. of Phys., Univ. of Cape Coast, Cape Coast, Ghana).
Sol. Energy (USA), vol.31, no.5, p.517-22 (1983).
Recently, Sayigh (Solar Energy Engineering, 1981) has given a compendium of the solar measuring instruments and has remarked on the importance of proper calibration. Since these instruments are not readily available in Ghana, it was decided to design and construct a simple differential sunshine recorder, that will record and measure direct solar radiation but would ignore 'sky' radiation (or diffuse radiation) scattered by the air molecules, water droplets in clouds, aerosols (dust, smoke, pollen) and gases present in the atmosphere (O_3, O_2, CO_2, H_2O). The theory, design and analysis of this instrument is presented. (4 refs.)

121405 Techniques for the precise estimation of hourly values of global, diffuse and direct solar radiation. A.Mani, S.Rangarajan (Indian Inst. of Tropical Meteorology, Bangalore, India).
Sol. Energy (USA), vol.31, no.6, p.577-95 (1983).
A method used to compute solar radiation, when no measured data are available, is the regression technique relating mean daily totals of global and diffuse solar radiation with the mean duration of sunshine. Using this method, regression parameters were obtained from the monthly mean values of daily totals of global solar radiation and sunshine at a network of 16 stations in India. Daily values of global and diffuse solar radiation were then computed for 121 stations using interpolated values of the regression parameters. Where no sunshine data was available, global and diffuse solar radiation were computed from cloud observations. By relating daily totals and the corresponding hourly values of global and diffuse solar radiation, two sets of curves were prepared valid for the whole country, using which mean hourly values of global and diffuse radiation could be deduced from the corresponding daily totals. The paper discusses the validity of the techniques for an extended network of 145 stations in India. Using a simple model, calculations of global and diffuse solar radiation on clear days were made for 145 stations from values of the solar constant and measured values of ozone, water vapour and atmospheric turbidity. A method of extending the technique to overcast skies and partly clouded skies is discussed. (15 refs.)

121406 The solution of seismic interpretation problems using the finite element method. V.N.Trojan.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.21-6 (Aug. 1983). In Russian.
Algorithms are suggested for solving the following seismic interpretation problems: determination of the seismic shape, estimation of the impulse response of the media and approximation of the seismic horizon. The iterative algorithm has been developed for determining seismic signal parameters. B-spline functions are used as basic functions in the finite element method. (3 refs.)

121407 Wireline logging and coal measures rock strength. P.A.S.Elkington.
Univ. Nottingham, England thesis, 1981
Instrumentation for the wireline logging of surface boreholes is described with special reference to the compact slimline systems designed for operation in small diameter coalfield holes. The use of logs as lithology indicators is outlined and some of the problems of interpretation in coal measures strata are highlighted. It is suggested that greater use could be made of wireline logs during the design phase of coal mining projects. In particular, their ability to predict intact rock strength is examined and the potential geotechnical applications are considered. Extensive use has been made of the point load strength test on rock core from deep boreholes drilled in Nottinghamshire and Staffordshire; testing at small regular intervals has enabled continuous strength curves to be generated and compared directly with down hole responses. Those logs best able to predict the rock strength are identified and the relationships are quantified using a log blocking procedure. A multivariate analysis technique is used to combine the log responses into a single strength prediction equation. Strength calibration is discussed and other log-derived properties are compared with laboratory measurements. Some conventional log interpretation methods are shown to be inadequate in coal measures strata.

121408 Classification of Landsat data by means of color-transformations. K.Conradsen, G.Nilsson (Inst. of Math. Statistics & Operations Res., Tech. Univ. of Denmark, Lyngby, Denmark).
Proceedings of the 3rd Scandinavian Conference on Image Analysis, Copenhagen, Denmark, 12-14 July 1983 (Lund, Sweden: Studentlitteratur 1983), p.164-72
Some methods are suggested for improving the numerical classifications of geological units by means of remotely sensed multispectral scanner (MSS) data from e.g. Landsat satellites. The methods are based on transforming the ratios between different MSS bands to a cylindrical coordinate system that approximates the Munsell colour coordinates hue, saturation and value. Some distributional results are presented and the method is tested on Landsat data from Greenland. (6 refs.)

121409 Two-dimensional filtering with one-dimensional approach: the scanner regression-filter (SRF). M.Ehlers (Inst. fur Photogrammetrie und Ingenieurvermessungen, Univ. Hannover, Hannover, Germany).
Proceedings of the 3rd Scandinavian Conference on Image Analysis, Copenhagen, Denmark, 12-14 July 1983 (Lund, Sweden: Studentlitteratur 1983), p.173-81
Scanner imagery recorded over homogeneous areas often shows typical scan-line-structures. This is especially true for high amplified thermal infrared data of water surfaces. The scan-line-noise is a great disadvantage for quantitative evaluation. So the noise has to be removed by previous digital filtering. For this purpose a special spatial domain filter, the scanner-regression filter (SRF) for scanner imagery is developed. With the assumption that scan-line-noise is column independent the two-dimensional problem can be solved with a one-dimensional approach. The SRF method is compared to common techniques in the spatial and frequency domain and shows best results. (8 refs.)

121410 The instrument for the determination of dissolved oxygen in seawater. Zhang Rongkun, Luo Yinghua, Weng Xinqiao, Deng Gumin (Xiamen Univ., China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.73-82
The instrument described is a new type of oxygen analyzer, based on an electroanalytical method—laminar flow chronocoulometry. It can determine the content of oxygen in seawater as well as environmental waters with high accuracy. The instrument features an automatic control sequence and high-speed operation. The oxygen content is displayed with $2^1/_2$ digit resolution. The water sample flows to the sealed electrode cavity automatically, isolated from air so that the results of determination are accurate and reliable. (7 refs.)

121411 Application of the atomic Voigt effect for the determination of the trace elements (Ag, Pb, Rb). Li Jia Xi, Deng Yi Chen, Yang Xiao Tao (Acad. of Geological Sci., China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.93-100
Atomic absorption spectrometry (AAS) and atomic fluorescence spectrometry (AFS) are widely used in routine analysis of the geological and environmental samples. However, the sensitivity and the efficiency of these methods is still not satisfactory. The technique of forward scattering or magnetic optic rotation (MOR) is an effective advanced method for improving both the limitations. The authors describe the characteristics of MOR, compare it with AAS and AFS for trace analysis, discuss the factors that govern the output signal and the linearity, and establish the working parameters for determining Ag, Pb, and Rb, which have detection limits of 3.4×10^{-13}g, 5.8×10^{-12}g, 5.4×10^{-13}g respectively. (8 refs.)

121412 Digital filtering of the data of sea-level survey [for earthquake prediction]. Hu Guan-rui (Shanghai Jiao Tong Univ., Shanghai, China), Duan Hua-chen.
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.289-95
Digital filtering methods for sea-level data analysis and the results acquired are discussed. By using monthly mean data and eliminating regular annual variation, the influence of the periodic factors on sea-level data has been removed. This method is universally applicable and is expected to provide information on premonitary symptoms of macroseism. (5 refs.)

121413 Scintillation modelling and measurement: a tool for remote-sensing slant paths. E.Vilar, J.Haddon (Dept. of Electrical & Electronic Engng., Portsmouth Polytech., Portsmouth, England).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.27/1-13
The use of spectral analysis of amplitude scintillations as a remote-sensing tool of a slanted path is investigated in order to derive values of C_n^2 (refractive index structure constant), turbulent path L, and dominant eddy size. Relevant propagation aspects are reviewed and extended, a layer model analysed in detail, and experimental results are presented and discussed. The limitations of the remote-sensing technique are also discussed, particularly the use of cross-path wind v_t. The remote-sensing of v_t is briefly outlined and relevant antenna aperture effects are also considered. (30 refs.)

94.00 AERONOMY AND SPACE PHYSICS

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

121414 Atmospheric sodium chemistry and diurnal variations: an up-date. V.W.J.H.Kirchhoff (Inst. de Pesquisas Espaciais, Conselho Nacional de Desenvolvimento Cientifico e Technologico-CNPq, Sao Paulo, Brazil).
Geophys. Res. Lett. (USA), vol.10, no.8, p.721-4 (1983).
Recent results for sodium reaction rates have led to a reassessment of the importance of atmospheric sodium constituents and their distribution with height. The largest changes occur at the bottom of the neutral atmospheric sodium layer. A much larger reaction rate coefficient for the three body production of NaO_2 makes this constituent potentially much more dense below about 80 km, whereas the inclusion of photolysis produces a large dirunal variation in the NaOH loss frequency. Because many of the Na reaction rates are still uncertain static calculations for four different options on reaction rates have recently been offered in the literature. The present author shows that only one of these choices is able to produce diurnal variations that are in agreement with recent measurements. (27 refs.)

121415 Lower thermospheric structure from Millstone Hill incoherent scatter radar measurements. I. Daily mean temperature. R.H.Wand (MIT, Haystack Obs., Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7201-9 (1 Sept. 1983).
Daytime temperature determinations from 151 days of incoherent scatter radar measurements at Millstone Hill (42.6°N) from 1970 to 1975 were analyzed to characterize the mean daily temperature in the lower thermosphere (105-125 km). An analytical model fitted to the measured temperatures contained terms to specify the dependencies of the mean daily temperature on day of year (annual and semiannual terms), solar cycle, solar rotation, and geomagnetic activity. The model representation, whose coefficients are tabulated, showed that seasonal, solar cycle, and geomagnetic effects were all of comparable magnitude and could each produce a variation of 5-10% in the mean temperature. The solar rotation effects were found to be small. (24 refs.)

121416 Lower thermospheric structure from Millstone Hill incoherent scatter radar measurements. II. Semidiurnal temperature component. R.H.Wand (MIT, Haystack Obs., Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7211-24 (1 Sept. 1983).
For pt.I see ibid., vol.38, no.A9, p.7211-24 (1983). Daytime temperature determinations from 151 days of incoherent scatter radar measurements at Millstone Hill (42°N) from 1970 to 1975 were analyzed to characterize the semidiurnal temperature oscillation in the lower thermosphere (105-125 km). An analytical model fitted to the measured temperatures contained terms to specify the dependencies of the semidiurnal term on day of year (annual and semiannual terms), solar activity, and geomagnetic activity. The model representation, whose coefficients are tabulated, showed that seasonal effects were larger than effects associated with the other parameters. The annual mean semidiurnal oscillation (for $Kp=0$, $\bar{F}_{10.7}=120$) had a maximum amplitude of 28K at 115 km and a vertical wavelength of 43 km. Variations associated with season were large. (28 refs.)

121417 Latitudinal (seasonal) variations in the thermospheric midnight temperature maximum: a tidal analysis. F.A.Herrero, H.G.Mayr, N.W.Spencer (Lab. for Planetary Atmospheres, NASA Goddard Space Flight Center, Greenbelt, MD, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7225-35 (1 Sept. 1983).
Recent observations of a seasonal oscillation in the time of occurrence of the thermospheric midnight temperature maximum suggest that even at low latitudes ($<20°$) there is a latitudinal (seasonal) variation in the amplitudes and phases of the higher-order tidal modes. Temperature data from the Atmosphere Explorer E Neutral Atmosphere Temperature Experiment have been used to investigate this question, obtaining the temperature as a function of local time at two mean latitudes: $-17.5°$ and $17.5°$. The altitude range covered is 250-400 km. the 24-hour temperature functions are obtained during the same time of the year in both hemispheres, and they show the midnight temperature maximum occurring earlier in the summer hemisphere than in the winter hemisphere. Tidal analysis of the temperature function shows that the observed variations can be accounted for by the first three tidal harmonics. (17 refs.)

121418 A point of view on semi-empirical thermospheric models. F.Barlier, C.Berger (CERGA/GRGS, Grasse, France).
Planet. & Space Sci. (GB), vol.31, no.9, p.945-66 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).
Different types of models of the thermosphere, either with experimental characteristics or with theoretical characteristics, have been elaborated since the Space Age. These models describe the variation of different parameters (temperature, density, pressure, concentrations etc.). A brief description of these models is given. As far as theoretical models are concerned, the conservation equations of energy, of momentum or mass and physico-chemical processes are taken into account. Experimental models are based upon empirical representation of variations of parameters at a reference altitude, assuming diffuse equilibrium for each component. (90 refs.)

121419 Determination of atmospheric composition and temperature from the UV airglow. R.R.Meier, D.E.Anderson,Jr. (E.O. Hulburt Center for Space Res., Space Sci. Div., Naval Res. Lab., Washington, DC, USA).
Planet. & Space Sci. (GB), vol.31, no.9, p.967-76 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).
Recent spectroscopic observations of atmospheric emissions in the UV region of the spectrum have been analyzed using laboratory-measured excitation cross-sections, models and observations of energetic electron fluxes and models of atmospheric composition. In both the airglow and the aurora, self-consistent pictures of the excitation processes and atmospheric composition have been obtained. It is shown that accurate quantitative determinations of thermospheric parameters can now be made from UV spectral observations, and that the composition and temperature can be obtained from altitude profiles of the emissions alone, without reliance on the absolute photoelectron flux. (29 refs.)

121420 Solar indices and solar UV-irradiances. L.Bossy (Inst. Royal Meteorologique, Brussels, Belgium).
Planet. & Space Sci. (GB), vol.31, no.9, p.977-85 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).
Daily values of the solar radio fluxes, Zurich relative sunspot number R_z, and solar Ca II plage indexes for the period 1957-1980 are analyzed in order to test the stability of the series with respect to time and solar activity. Then, the daily solar UV-irradiances measured since 1969 for H Lyman-alpha and beta, the He I resonance line and He II Lyman alpha are compared with the 10.7 cm radio fluxes and adjusted. This adjustment allows the determination of the slope of the mean variation of the UV-irradiances with solar activity. The increases from solar minimum to solar maximum related to the minimum values are respectively: 60% for H Lyman alpha, 80% for H Lyman beta and 90% for He I and He II. (12 refs.)

121421 Photodissociation effects of solar UV radiation. P.C.Simon, G.Brasseur (Inst. d'Aeronomie Spatiale de Belgique, Bruxelles, Belgium).
Planet. & Space Sci. (GB), vol.31, no.9, p.987-99 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).
Reviews the current knowledge of UV solar irradiances beyond 120 nm measured during solar cycle 21. Parameters required to calculate the atmospheric attenuation of the UV radiation and the photodissociation rate of neutral constituents are discussed. The effect of scattering is also considered. (85 refs.)

121422 Excitation of acoustic gravity waves by sources moving in the atmosphere at an angle with the horizon. G.I.Grigor'ev, O.N.Savina (Sci.-Res. Inst. of Radiophys., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.532-41 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.750-60 (July 1982). [received: Sept. 1983]
The Cerenkov radiation of acoustic gravity waves by sources moving with a constant velocity in the atmosphere at an angle with the horizon is investigated. Relations for the amplitude and radiated power of these waves are derived and analyzed in several limiting cases. The constant-phase surfaces of the generated disturbances are determined. (14 refs.)

94.10S Aurora

121423 Simultaneous observations of tropicl arc SAR arc and aurora during geomagnetic storms from IC-Bulgaria-1300 satellite. M.M.Gogoshev (Central Lab. for Space Res., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.779-82 (1983).
The features: SAR arcs, tropical arcs and auroras are discussed particularly in the context of electric and magnetic fields, electron and proton fluxes, ion composition, plasma drift and spectra. (10 refs.)

121424 A statistical study of the dynamics of the equatorward boundary of the diffuse aurora in the pre-midnight sector. J.A.Sauvaud, J.Crasnier (CNRS-Univ. Paul Sabatier, Toulouse, France), Yu.I.Galperin, Y.I.Feldstein.
Geophys. Res. Lett. (USA), vol.10, no.8, p.749-52 (1983).
Presents a statistical study of the dynamics of the equatorward boundary of the diffuse aurora. This soft electron boundary appears to be best fitted by using the AE index values averaged over the 5 hours preceding the measurements. This inertia of the boundary is interpreted as indicative (1) of the action of a polarization electric field braking the inward motion of the corresponding equatorial plasma during increasing magnetic activity so that several successive perturbations are needed to obtain a consequent inward displacement and (2) of a weak wave-particle interaction during periods of decreasing magnetic activity. (20 refs.)

121425 A quantitative description of the spatial distribution and dynamics of the energy flux in the continuous aurora. J.A.Whalen (Air Force Geophys. Lab., Hanscom AFB, MA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7155-69 (1 Sept. 1983).
Energy flux in the continuous (or diffuse) aurora is found to be constant instantaneously along contours that are defined analytically as a function of magnetic latitude and UT, coordinates that are approximately circles in magnetic latitude-magnetic local time centered at a pole offset from the magnetic pole. As a consequence, the latitudinal distribution in these coordinates is the same instantaneously at all magnetic local times (the observed extent of which is 10 hours); changes that take place in the distribution do so simultaneously (within 15 min of UT resolution) throughout this entire extent. These properties are observed in a case study of 8 hours duration by an array of ground and air based ionospheric sounders that span the 10 hours of magnetic local time at auroral latitudes. Energy flux in the continuous aurora is derived from the resulting ionized auroral E layer critical frequency that is measured simultaneously at 15 min intervals by all members of the array. (32 refs.)

121426 Analytical yield spectrum approach to electron energy degradation in Earth's atmosphere. S.A.Haider, R.P.Singhal (Appl. Phys. Section, Inst. of Technol., Banaras Hindu Univ., Varanasi, India).
J. Geophys. Res. (USA), vol.88, no.A9, p.7185-9 (1 Sept. 1983).
Analytical spatial yield spectrum approach has been applied to calculate the electron flux, volume excitation, and ionization rates for monoenergetic electrons incident on the Earth's atmosphere. The results have been compared with the previous model calculations of Mantas and Walker (1976) and Banks et al. (1974). (17 refs.)

94.20 PHYSICS OF THE IONOSPHERE

(for planets, see 96.30)

121427 Probing the ionosphere an aid to research. A.Farmer (Rutherford Appleton Lab., Chilton, England), R.Norton.
Commun. Aust. (Australia), vol.2, no.3, p.24-5, 27 (Aug. 1983).
Discusses the European Incoherent Scatter Scientific Association (EISCAT) research programme. It uses two radar systems, a 6 MW VHF transmitter-receiver and a UHF system with three ground stations for investigating radio propagation. The UHF system consists of a 933.3 MHz transmitter-receiver located in Norway. (no refs.)

121428 Equatorial ionospheric currents derived from MAGSAT data. M.Roy (Indian Inst. of Geomagnetism, Colaba, Bombay, India).
Geophys. Res. Lett. (USA), vol.10, no.8, p.741-4 (1983).
The MAGSAT data on the three components of the geomagnetic field are subjected to ring current correction and crustal anomaly elimination near the dip equator. The evidence of a strong west east electrojet current below the satellite height ($\sim$ 350 km) is confirmed. Strong evidence of an east west component of the field suggests the existence of a vertical current originating at the jet level and extending upwards. A model calculation shows that such a current system can explain the satellite data as well as the ground data. (7 refs.)

121429 Upward electron beams measured by DE-1: a primary source of dayside region-1 Birkeland currents. J.L.Burch (Dept. of Space Sci., Southwest Res. Inst., San Antonio, TX, USA), P.H.Reiff, M.Sugiura.
Geophys. Res. Lett. (USA), vol.10, no.8, p.753-6 (1983).
Measurements made by the High Altitude Plasma Instrument on DE-1 have shown that intense upward electron beams with energies from $\approx$20 eV to $\approx$200 eV are a common feature of the region just equatorward of the morning-side polar cusp. Computations of the currents carried by these beams and by the precipitating cusp electrons show excellent agreement with the simultaneous DE-1 magnetometer measurements for both upward and downward Birkeland currents. The data indicate that cold ionospheric electrons, which carry the downward region-1 Birkeland currents on the morning side, are accelerated upward by potential drops of a few tens of eV at altitudes of several thousand kilometers. This acceleration process allows spacecraft above those altitudes to measure routinely the charge carriers of both downward and upward current systems. (19 refs.)

121430 Sunrise effect on long wave propagation along the Tashkent-Patiala path. A.Sayal, D.Singh, H.S.Gurm (Dept. of Astron. & Space Sci., Punjabi Univ., Patiala, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.74-6 (June 1983).
Data from the 164 kHz long wave propagtion observations at Patiala are analysed to find the factors responsible for the observed sunrise effect. Monthly variation of solar zenith angle at the sunrise time is similar to the monthly variation of the total ozone content which points to the presence of an ozone screening layer at pre-sunrise time. The results also indicate that at the midpoint of Tashkent-Patiala path cosmic Kray ionization plays an important role during sunrise. The start of the sunrise effect is a result of UV light grazing the ozone screening layer and the release of electrons at $\chi=98°$ is due to the photodetachment of NO_3^-. (10 refs.)

121431 Low latitude integrated production and loss rates from Faraday rotation experiment using ATS-6 and ETS-II satellite transmissions. R.S.Dabas, P.K.Bhuyan, T.R.Tyagi, L.Singh, Y.V.Somayajulu (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.81-3 (June 1983).
Faraday fading records obtained near sunrise at Gauhati and Delhi using ATS-6 transmissions (1975-76) and at Delhi using ETS-II transmissions (1979-80) are analyzed to obtain the integrated production rate for the overhead Sun (Q_0) and the effective loss rate (β). The results of Q_0 and β are quite dissimilar for the two stations. An attempt is made to explain qualitatively the observed variations with the neutral composition changes of the (N_2/O) ratio. (21 refs.)

121432 Ionospheric electron content measurements at a northern low mid-latitude station through half a solar cycle. P.K.Bhuyan, T.R.Tyagi, L.Singh, Y.V.Somayajulu (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.84-93 (June 1983).
Ionospheric electron content (IEC) measurements with the help of geostationary satellite radio beacon have been made at Delhi during the period 1975-80. Results for three 1-yr periods representing low, medium and high solar activity conditions are presented. Detailed study of the diurnal, seasonal and solar cycle variations reveals a number of new features which were not observed earlier from observations made with low orbiting satellites. Study of the behaviour of IEC during different hours of the day with season and solar activity reveals that IEC behaves differently in daytime and nighttime. Also, the harmonic components beyond the third one do not show any significant values. (56 refs.)

121433 F-region vertical velocity and its fluctuations at the magnetic equator. K.S.V.Subbarao, B.V.Murthy (Space Phys. Div., Vikram Sarabhai Space Centre, Trivandrum, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.94-6 (June 1983).
F-region vertical velocities in the evening time are estimated at two levels from simultaneous phase-path observations on two frequencies, 2.2 and 4.1 MHz. It is found that electrodynamic drift is greater at lower level than that at higher level. Wave-type disturbances with a period of 9 min are observed. (5 refs.)

121434 D-region model study for Udaipur. T.C.Bansal, S.K.Vijayvergia, R.K.Rai (Dept. of Phys., Univ. of Udaipur, Udaipur, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.97-9 (June 1983).
On the basis of a simplified ion-chemical scheme a D-region model is prepared. Multifrequency absorption results measured at Udaipur match with the electron density profile obtained from the scheme. The results are compared with positive ion and electron concentrations measured at the same solar zenith angle position over Thumba. The scheme used is slightly different from that of the existing ones in both negative and positive ion sides. (26 refs.)

121435 Energetic electron precipitation due to gyroresonant interactions in the magnetosphere involving coherent VLF waves with slowly varying frequency. H.C.Chang, U.S.Inan, T.F.Bell (Space, Telecommunications & Radiosci. Lab., Stanford Univ., Stanford, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7037-50 (1 Sept. 1983).
A test particle simulation model (Inan et al., 1982) of the gyroresonance wave-particle interaction in the magnetosphere is extended to study the transient particle precipitation fluxes induced by various coherent VLF waves with slowly varying frequency propagating along the Earth's magnetic field lines. For moderate wave intensities ($B_\omega \leq 10$ pT at $L=4$) a comparison between input signals with linearly rising and falling frequencies shows that they induce the same amount of precipitated particle energy deposition. However, when the wave growth near the principal interaction region is considered, the precipitation induced by a riser is considerably higher than that induced by a faller. (33 refs.)

121436 Standing wave patterns in VLF Hiss. R.Brittain, P.M.Kinter, M.C.Kelley (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA), J.C.Siren, D.L.Carpenter.
J. Geophys. Res. (USA), vol.88, no.A9, p.7059-64 (1 Sept. 1983).
Observations have been made of systematic patterns in VLF hiss, which can be interpreted as a standing wave pattern formed by reflection in the lower ionosphere. Multicomponent VLF electric and magnetic field experiments were flown on three sounding rockets (Nike-Tomahawk 18.203-305) from Siple Station. Antarctica during December 1980 to January 1981. One feature of the natural emissions was observed in a very similar form during each flight. A band of hiss, typically from 1.5 to 3 kHz, was seen on the upleg to form a series of closely spaced stripes with whistler-like dispersion. These first appeared at an altitude of 90-95 km and extended for as much as 40 km in alitutde. On the downleg the stripes were observed at the same altitude with the pattern reversed in time. No such patterns were observed by the VLF receivers operating at the same time on the ground at Siple or at its conjugate point. It is suggested that the patterns are interference effects due to downcoming waves reflecting from a layer in the *E* region and forming a standing wave pattern. (15 refs.)

121437 In situ measurements of transionospheric VLF wave injection. P.M.Kintner, R.Brittain, M.C.Kelley (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA), D.L.Carpenter, M.J.Rycroft.
J. Geophys. Res. (USA), vol.88, no.A9, p.7065-73 (1 Sept. 1983).
VLF waves at 3.85 kHz from the Siple, Antarctica, transmitter were continuously measured by electric and magnetic receivers on a sounding rocket as the waves propagated through the neutral atmosphere and into the ionosphere. The change from linear to circular polarization was clearly observed along with severe attenuation of the VLF signal in the *D* region. Interferometric measurements established the index of refraction and provided an independent calibration of the rocket-borne receivers. An upper bound on the VLF power radiated is estimated to be 1.7×10^3 W during a period when the antenna was

driven at 115×10^3 W. The power estimated to be entering the ionosphere is between 3 W and 12 W. (24 refs.)

121438 Observations and modeling of multi-frequency VHF and GHz scintillations in the equatorial region. S.J.Franke, C.H.Liu (Ionosphere Radio Lab., Univ. of Illinois, Urbana, IL, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7075-85 (1 Sept. 1983).
Amplitude scintillation spectra and statistics obtained simultaneously at VHF (257.55 MHz), L band (1541.5 MHz), and C band (3945.5 MHz) from the MARISAT communications satellite (15°W) are presented. The measurements were made at Ascension Island (7°58′S, 14°25′W, 30°S DIP) over a high elevation propagation path within a few degrees of the magnetic meridian plane. The multi-frequency data and the unique propagation geometry enable study of the structures of the equatorial ionospheric irregularities closely. Numerical simulation is used to model a specific event. Comparisons between the modeling results and the observations indicate that the data are consistent with the recently measured (in situ) two-component power law irregularity spectrum with a shallow largescale regime and a steeper smallscale regime, and a spectral break at about 1-km scale size. (22 refs.)

121439 Ion-Pedersen drift and parallel electric field effects on plasma jetting. J.L.Sperling (Jaycor, San Diego, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7095-106 (1 Sept. 1983).
The combination of ion-Pedersen currents and parallel electric fields are shown to affect significantly both the jetting of ionospheric plasma clouds transverse to the geomagnetic field and the Alfven waves generated by the moving plasma. Ion-Pedersen currents and parallel electric fields invalidate the 'frozen-in' field approximation and cause Alfven waves to decay. They also imply an eigenvalue condition on the size of the plasma cloud transverse to the geomagnetic field and the direction of cloud motion. The attenuation of Alfven waves reduces the likelihood that the waves can cause an electromagnetic pulse on the ground and implies that the initial directed energy in the plasma jet is coupled, over great distances, to ions and electrons. (18 refs.)

121440 Altitude and structure of an auroral arc acceleration region. G.Paschmann, J.Papamastorakis, N.Sckopke, G.Haerendel (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Extraterrestriche Phys., Garching, Germany), E.G.Shelley.
J. Geophys. Res. (USA), vol.88, no.A9, p.7121-30 (1 Sept. 1983).
During a rocket flight in the dayside auroral oval on December 17, 1974, several examples of velocity dispersions of precipitating electrons were observed. It is shown that the commonly employed interpretation of such dispersions as resulting from a purely temporal modulation of the source is not unique: the same dispersion effects can also be caused by a moving source of finite width and constant intensity. This spatial model is further improved by adding the dispersion originating from a superimposed convection velocity. In general the source altitudes implied by the two models (temporal and spatial) differ. (30 refs.)

121441 Spatial relationship of field-aligned currents, electron precipitation, and plasma convection in the auroral oval. W.R.Coley (Center for Space Sci., Univ. of Texas, Dallas, TX, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7131-41 (1 Sept. 1983).
The utilization of magnetometer measurements to determine field-aligned current structure in conjunction with energetic particle and plasma convection measurements from AE-C enables the author to determine relationships between these phenomena in the nighttime auroral zone. From a study of some 18 auroral oval crossings in the sectors 1800-2200 MLT and 0100-0600 MLT it is observed that, in general, the regions of energetic electron precipitation (>1 keV) span both region 1 and region 2 currents with the poleward boundary of the region 1 currents approximately coincident with the poleward kilovolt electron boundary. Simultaneous observations of plasma convection indicate that the reversal from sunward to antisunward convection is also, in general, collocated to within a degree of invariant latitude to the poleward field-aligned current boundary in both the evening and morning sectors. (34 refs.)

121442 A theoretical approach to the morphology and the dynamics of diffuse auroral zones. D.Fontaine, M.Blanc (CNET, Issy-les-Moulineaux, France).
J. Geophys. Res. (USA), vol.88, no.A9, p.7171-84 (1 Sept. 1983).
The authors focus upon a quantitative description of the effects of large-scale convection on diffuse precipitation. The transport of 100 eV-10 keV electrons from the geomagnetic tail earthward by the convection electric field, and their pitch angle diffusion into the loss cone by wave-particle interactions are believed to be the main cause of diffuse auroral electron precipitation. For the main purpose of diffuse precipitation modeling, the authors propose a simplified approach to this problem and test its validity against direct observations of the location and dynamics of diffuse auroral emissions. Using basically the strong pitch angle of diffusion limit a set of fluid equations describing the three-dimensional transport of plasma sheet electrons is derived. Their integration provides the latitude and local time distribution of precipitation fluxes and characteristic energies at the top of the ionosphere as a function of the large-scale dawn to dusk electrostatic potential drop. The calculated expansion of the auroral oval with magnetic activity, deduced from this model, approaches the experimental results. (39 refs.)

121443 Photochemistry of N_2^+ in the daytime F region. E.L.Breig, W.B.Hanson, J.H.Hoffman (Center for Space Sci., Univ. of Texas, Dallas, TX, USA), W.A.Abdou.
J. Geophys. Res. (USA), vol.88, no.A9, p.7190-200 (1 Sept. 1983).
The photochemistry of N_2^+ in the daytime F region continues to be a source of concern due primarily to the uncertain roles of the metastable $O^+(^2D)$ ion and possible vibrational excitation. This investigation adopts a unique subset of data from the Atmosphere Explorer C satellite that spans distinct regions near the low-latitude F peak wherein either chemical reactions or electron processes alternatively control the N_2^+ abundances. Concentrations of N_2^+ calculated according to current theory and including recent laboratory data for $O^+(^2D)$ losses via N_2 are found to exceed ionospheric observations between 220 and 400 km by a factor near 2. Relevant characteristics of the basic molecular ion concentration measurements are described, along with an analysis for select orbits conducted according to current photochemical equilibrium theory. (39 refs.)

121444 Parametric excitation and suppression of convective plasma instabilities in the high-latitude *F* region ionosphere. M.J.Keskinen (Plasma Phys. Div., Naval Res. Lab., Washington, DC, USA), P.K.Chaturvedi, S.L.Ossakow.
J. Geophys. Res. (USA), vol.88, no.A9, p.7239-44 (1 Sept. 1983).
Parametric coupling processes of a large-amplitude electromagnetic pump wave with convective plasma fluid instabilities ($\mathbf{E}\times\mathbf{B}$ gradient drift and current convective) in the high-latitude *F* region ionosphere have been studied. It was found that a pump wave, with frequency near the upper hybrid frequency and with electric field component perpendicular to the ambient magnetic field, can stabilize or destabilize the $\mathbf{E}\times\mathbf{B}$ gradient drift and/or current convective instability. For parameters typical of the nighttime high-latitude *F* regiono ionsphere the authors found stabilization or destabilization with a vertically incident *O* mode carrying a free space incident power density of the order of 10^{-4} W/m^2. (44 refs.)

121445 HF direction finding by wave front testing in a fading signal environment. D.W.Rice (Communications Res. Centre, Ottawa, Ontario, Canada).
Radio Sci. (USA), vol.17, no.4, p.827-36 (July-Aug. 1982). [received: Oct. 1983]
Calculations are reported of the probability of observation of various degrees of phase front nonlinearity for two and three signals incident from different directions upon a phase-measuring array. It is assumed that the signals fade independently and that their amplitude probability densities are described by a Rayleigh law. The measure of phase front nonlinearity employed is the RMS deviation from the best straight-line fit to the measured phases along a linear array. Experimental measurements over a 911-km mid-latitude path and a 2100-km auroral-zone path confirm the general behaviour predicted by the theory. (12 refs.)

121446 Automatic calculation of electron density profiles from digital ionograms. II. True height inversion of topside ionograms with the profile-fitting method. Huang Xueqin, B.W.Reinisch (Univ. of Lowell Center for Atmospheric Res., Lowell, MA, USA).
Radio Sci. (USA), vol.17, no.4, p.837-44 (July-Aug. 1982). [received: Oct. 1983]
For pt.I see ibid., vol.17, no.2, p.421-34 (1982). An efficient electron density profile inversion algorithm is developed for use on automatically scaled digital topside ionograms. The profile fitting method models the topside ionosphere with a single polynomial, a method particularly suited for autoscaled data because it is not too sensitive to a certain amount of scatter in the $h'(f)$ data and it makes use of ordinary and extraordinary ray echoes. The program is applied to input data consisting of *O* and *X* trace segments obtained from automatic scaling of a number of digitized ISIS ionograms. (13 refs.)

121447 On the analysis and interpretation of spaced-receiver measurements of transionospheric radio waves. C.L.Rino, R.C.Livingston (SRI Internat., Menlo Park, CA, USA).
Radio Sci. (USA), vol.17, no.4, p.845-54 (July-Aug. 1982). [received: Oct. 1983]
A correlation analysis method developed by Armstrong and Coles (1972) has been applied to spaced-receiver data from the Wideband satellite. The method permits simultaneous estimation of the anisotropy and true drift of the diffraction pattern. The scintillation theory is applied to interpret the measured variations in anisotropy and pattern drift. The results show that in anisotropic media there is a complicated interplay between apparent drifts and the anisotropy of the diffraction pattern that must be accommodated in spaced-receiver data analyses. The method has been applied to verify the *L*-shell aligned, cross-field anisotropy of *F*-region auroral zone irregularities. (21 refs.)

121448 On the application of phase screen models to the interpretation of ionospheric scintillation data. C.L.Rino (SRI Internat., Menlo Park, CA, USA).
Radio Sci. (USA), vol.17, no.4, p.855-67 (July-Aug. 1982). [received: Oct. 1983]
Presents a review of the application of the phase screen model to the interpretation of data from the Wideband satellite (international designation P76-5). The signal structure and experiment configuration allowed measurements of temporal, spatial, and frequency coherence for a wide variety of scintillation conditions. The derived scintillation parameters are in excellent agreement with the phase screen theory. The principal results can be summarized with simple algebraic formulas for the scintillation level, spatial temporal coherence and frequency coherence or coherence bandwith. With appropriate manipulations, the formulas fully accommodate the propagation angle dependence in highly anisotropic media. (62 refs.)

121449 Anomalous absorption effects produced by high power radio waves in the high lattitude ionosphere. T.B.Jones, T.Robinson (Dept. of Phys., Univ. of Leicester, Leicester, England), P.Stubbe, H.Kopka.
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.5/1-9
High power HF radio waves can produce plasma instabilities in the ionosphere which induce major changes in the propagation characteristics of other HF signals propagating through the disturbed region. Experiments to investigate some of these disturbance effects have been undertaken using the Max Planck Institut fur Aeronomie, Lindau heating facility at Tromso, Norway. Particular attention is given to the anomalous absorption effects discovered and to the induced phase changes observed in the diagnostic signals. The observations are interpreted in terms of the plasma instabilities generated and are of interest in assessing the performance of HF communication systems when disturbances of this nature are produced in the ionosphere. (13 refs.)

121450 VHF-long-distance-propagation by auroral backscatter. G.Lange-Hesse (Max-Planck Inst. fur Aeronomie, Katlenburg, Lindau, Germany).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.8/1-14
Extended investigations of VHF auroral backscatter communications had been carried out in Europe in the years from 1958 to 1969 using the results of the observations of beacon transmitters and of an extended network of amateur radio stations covering large parts of Europe. The frequency of occurrence of this kind of propagation as a function of geomagnetic activity and latitude, time of day, season and sunspot cycle is shown by several diagrams. The physical reasons for this backscatter phenomenon and especially for the typical daily variation in the frequency of occurrence are discussed. Proposals are made for special arrangements to suppress this kind of propagation in case of frequency sharing. (52 refs.)

121451 Interference and sharing at medium frequency skywave propagation considerations. J.C.H.Wang (Federal Communications Comm., Washington, DC, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.9/1-13
A considerable amount of work dealing with night time skywave propagation has been done; however, some areas remain to be explored. For example, short-term variation of field strengths has been overlooked. Daytime propagation is far from being quantitatively understood. Also, it is not quite possible to determine interfering signal levels which may be present for a small percentage of time with high accuracy. During sunspot cycles 18 and 19, the Federal Communication Commission conducted an extensive field-strength measurement program in the midlatitude areas of North America. These and

other data are revisited with a new emphasis, namely, interference and sharing. This paper discusses, among other things, determination of field strengths exceeded for different percentages of time (1 to 99%), diurnal variation of field strengths, favorable conditions for daytime skywave propagation, effect of magnetic storms, frequency dependence as observed at daytime and nighttime. (28 refs.)

121452 Anomalous propagation behaviour of radio signals at high latitudes. R.Hunsucker (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.11/1-15
Signals in the 3 to 30 MHz (HF) band propagated through polar and auroral ionospheric regions sometimes undergo some unique and profound changes. The channel capacity, intelligibility and reliability of these signals are affected by multipath distortion, backscatter, non-great-circle propagation and other high latitude anomalies. Signals propagated in the VLF, LF, MF, VHF/UHF and microwave portions of the radio spectrum also undergo some very deleterious effects. (59 refs.)

121453 The application of real-time model update by oblique ionospheric sounders to frequency sharing. D.R.Uffelman, L.O.Harnish, J.M.Goodman (E.O. Hulbert Center for Space Res., Naval Res. Lab., Washington, DC, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.12/1-11
Frequency management systems for the high frequencies (HF) currently in use by the US Department of Defense (DoD) rely heavily on manual selection of frequencies which have been allocated on a circuit by circuit basis. There is no capability to anticipate frequency changes (QSYs) in advance in a manner such that a frequency being released by one user can be utilized effectively and immediately by a second user. NRL has been examining a scheme by which a small computer model of the MUF of the HF channel (MINIMUF 3.5) can be made to perform very accurately to anticipate channel characteristics in a short term prediction mode. It is proposed that this model be utilized to provide automated frequency management which would allow one to anticipate frequency availability and thereby allow sharing of frequencies between several users. Utilizing data obtained from an oblique sounder net on the East Coast of the United States, this paper demonstrates the manner in which this might be accomplished. (9 refs.)

121454 The development of an ionospheric model thesaurus and user's guide. J.M.Goodman (E.O. Hulbert Center for Space Res., Naval Res. Lab., Washington, DC, USA).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.13/1-12
Describes the preliminary progress on the development of a comprehensive survey of ionospheric models—both physical and empirical—which have been, are, or would be employed to evaluate the operation of military radiowave systems. Also to be contained in the survey are forecasting/prediction techniques and propagation effects models together with an evaluation of each based upon available documentation. This work is authorized and funded by the Naval Research Laboratory and promulgated under the aegis and guidance of the NATO-AGARD EPP. (32 refs.)

121455 Fading statistics of C-band satellite signal during solar maximum years (1978-1980). D.J.Fang (Propagation Studies Dept., Comsat Labs., Clarksburg, MD, USA), C.H.Liu.
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.30/1-4
From January 1978 to June 1980, scintillation experiments were conducted at the Hong Kong earth station. INTELSAT satellite signals at 4 GHz were received via both the Pacific Ocean Region (POR) and Indian Ocean Region (IOR) satellite-earth links. Severe intensity scintillations with peak-to-peak fluctuations up to 14 dB were observed on many evenings during the equinoctial period. This paper presents detailed statistics of the scintillating signals. The level of fluctuations based on the scintillation index is evaluated, and fading rates in terms of the coherence time are examined and correlated with the level of scintillation. Power spectrum densities are also assessed. The high-frequency asymptotes, i.e. the roll-off slopes at frequencies above the Fresnel frequency, as approximated by f^{-n}, are derived for different levels of fluctuations. For system applications, various cumulative statistics, including annual and worst-month statistics, diurnal variations, and sunsport cycle dependence are summarized. (17 refs.)

94.30 PHYSICS OF THE MAGNETOSPHERE

(for planets, see 96.30)

121456 Structure of South Atlantic anomaly in maximum of 21st solar cycle by satellite IC-Bulgaria-1300 data. T.N.Gogosheva (Central Lab. for Space Res., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.783-6 (1983).
The anomaly was investigated by a photometer admitting no light—i.e. recording only its dark current. Particles of the South Atlantic anomaly penetrate the photometer causing the dark current to vary. The variation of the dark current over several orbits is discussed. (10 refs.)

121457 Fine structure of the magnetopause based on measurements of the Prognoz-7 and Prognoz-8 satellites. O.L.Vaisberg, A.A.Galeev, L.M.Zelenyi, G.N.Zastenker, A.N.Omel'chenko, S.I.Klimov, S.P.Savin, Yu.I.Ermolaev, V.N.Smirnov, M.N.Nozdrachev.
Cosmic Res. (USA), vol.21, no.1, p.49-55 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.57-63 (Jan.-Feb. 1983). [received: Sept. 1983]
The fine structure of the magnetopause is investigated using data from the SKS-04 instrument on Prognoz-7 and the plasma-wave complex on Prognoz-8. Three crossings of the magnetopause, distinguished by the sharp character of the plasma boundary, are analyzed. Two of these crossings were recorded in the direct transmission mode, making it possible to trace the evolution of the energy spectrum at the plasma boundary. Wave measurements in the ELF range record a burst of lower-hybrid oscillations and determine their role in the formation of the magnetopause structure. (5 refs.)

121458 A study of the plasma mantle in the Earth's magnetosphere. III. Acceleration of ions. N.F.Pisarenko, E.M.Dubinin, A.V.Zakharov, R.Lundin, B.Hiltqvist.
Cosmic Res. (USA), vol.21, no.1, p.56-66 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.64-75 (Jan.-Feb. 1983). [received: Sept. 1983]
For pt.II see Kosm. Issled., vol.20, no.3, p.387-98 (1982), or Cosmic Res., vol.20, no.3, p.281-9 (1982). Data from the Promiks-1 experiment aboard the Prognoz-7 satellite are used to examine the acceleration processes of ionospheric ions. (20 refs.)

121459 Relationship between the intensity of sporadic radio emission of the Earth's magnetosphere in the frequency range 0.7-2.3 MHz and soft electron fluxes (0.2-10 keV). G.M.Artem'eva, V.V.Pisareva, B.I.Savin, A.F.Tarasov.
Cosmic Res. (USA), vol.21, no.1, p.67-72 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.76-82 (Jan.-Feb. 1983). [received: Sept. 1983]
Compares measurements of the intensity of radio emission from the Earth's magnetosphere in the frequency range 0.7-2.3 MHz and irregular soft electron fluxes (0.2-10 keV) obtained by equipment on the Elektron-2 and Elektron-4 satellites. It is found that the nighttime maximum frequency for the appearance of soft electron fluxes falls within regions located near the maximum values for the intensity of sporadic radio emission, except for the premorning sector. (13 refs.)

121460 Small-scale structure of Birkeland currents with anomalous resistance and the problem of thermal balance. V.A.Liperovskii, G.A.Skuridin, S.L.Shalimov.
Cosmic Res. (USA), vol.21, no.1, p.82-91 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.95-105 (Jan.-Feb. 1983). [received: Sept. 1983]
In regions of wave electrostatic turbulence (RWERT) occurring in field tubes with longitudinal currents there is intense turbulent heating of particles. However, according to observations, the temperature of the main part of the plasma stays constant. A possible mechanism is proposed for removing energy from the RWET with ambipolar anomalous diffusion of a small number of high-speed ions which have received energy in the interaction with waves, through the transverse boundaries of the field tubes with currents. The estimates show that the mechanism proposed for removing energy is sufficiently effective for RWET transverse dimensions of the order of a kilometer, and for a boundary layer thickness of the order of Larmor radius for the thermal ions. (26 refs.)

121461 Comparison of spherical double probe electric field measurements with plasma bulk flows in plasmas having densities less than 1 cm^{-3}. F.S.Mozer (Phys. Dept., Univ. of California, Berkeley, CA, USA), E.W.Hones, J.Birn.
Geophys. Res. Lett. (USA), vol.10, no.8, p.737-40 (1983).
Point-by-point comparisons of ISEE-1 spherical double probe dawn-to-dusk electric field measurements and ISEE-2 plasma flows, converted to electric fields, are presented during a three hour time interval in the magnetotail when the plasma density varied from less than 0.1 to about 1 cm^{-3}. The zero lag cross-correlation coefficient between 768 second averages of the two data sets was 0.93. The cross-correlation coefficient decreased with shorter averaging intervals due to the increasing magnitude of statistical uncertainties, becoming 0.49 for 9 second averages. A statistical relative uncertainty between pairs of points in the two data sets, estimated by inclusion only of counting statistics in the plasma measurement and time variations of the observed electric field during the measurement interval, is able to account for at least 75% of the deviations between the two data sets. (10 refs.)

121462 Simulation of auroral current sheet equilibria and associated V-shaped potential structures. N.Singh, H.Thiemann, R.W.Schunk (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.745-8 (1983).
Results from numerical simulations of auroral current sheet equilibria and associated V-shaped potential structures are presented. It is shown that with allowance for both hot magnetospheric ion and cold ionospheric ion populations, the perpendicular potential drop, ϕ_m, associated with a non-neutral auroral current sheet is critically controlled by the temperature of the 'heated' ionosphere ions. The heating is caused by the wave turbulence excited by the auroral current sheet. In the presence of heated ionospheric ions, a relatively large variation in the temperature of the hot magnetospheric ion population causes a very small variation in the potential drop ϕ_m. The perpendicular potential drop acts to produce a V-shaped double layer with multiple potential steps parallel to the magnetic field when a zero potential boundary condition is imposed at the ionospheric boundary. Outside the V-shaped potential structure, ionospheric return currents develop self-consistently. (8 refs.)

121463 Geos 2 plasma drift velocity measurements associated with a storm time Pc5 pulsation. A.D.M.Walker (Dept. of Phys., Univ. of Natal, Durban, S Africa), H.Junginger, O.H.Bauer.
Geophys. Res. Lett. (USA), vol.10, no.8, p.757-60 (1983).
The Geos 2 electron gun experiment has been used to obtain electric field data during the compressional Pc5 pulsation event of Day 300, 1979. The phase relationships between the electric field and magnetic field observations

show that the oscillation in the meridian plane appears to be a transverse Alfven standing wave in the second harmonic, while the compressional oscillation is symmetrical about the equatorial plane. Computations of the fields of a guided poloidal wave fit the transverse oscillation well. The oscillation is not completely explained by existing theories. A comprehensive model of the oscillation is presented. (17 refs.)

121464 Ring coupling model: implications for substorm onsets. N.U.Crooker, G.L.Siscoe (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.8, p.761-4 (1983).
In the ring coupling model the criterion for substorm onset is the narrowing of the auroral oval to some critical limit. The auroral oval is taken to be the annulus bounded by Rings 1 and 2, corresponding to the locations of the Iijima-Potemra Regions 1 and 2 Birkeland currents. It is shown that this criterion is met following both southward and northward turnings of the interplanetary magnetic field (IMF). The behavior of the rings in response to typical variations in the north-south component of the IMF produces a variety of observed substorm sequence patterns. The energy source for substorms in the model is the solar wind energy stored in the magnetotail, whereas the energy for geomagnetic storms comes directly from the solar wind. The model is consistent with the half-wave rectifier response of the magnetosphere to the IMF. (19 refs.)

121465 A theory of long period magnetic pulsations. III. Local field line oscillations. A.Hasegawa (Bell Labs., Murray Hill, NJ, USA), K.H.Tsui, A.S.Assis.
Geophys. Res. Lett. (USA), vol.10, no.8, p.765-7 (1983).
For pt.II see J. Geophys. Res., vol.79, p.1033-7 (1974). A theoretical discussion is presented that supports the conjecture of a wide band source to excite harmonics for a given field line. That is, the local field line can in fact oscillate at its resonant frequency in response to a wide band source whose frequency spectrum covers the resonant frequency(ies). (11 refs.)

121466 Solar wind stream characteristics and low latitude geomagnetic field changes. G.K.Rangarajan (Indian Inst. of Geomagnetism, Bombay, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.65-7 (June 1983).
The passage of high speed solar wind streams past the Earth enhances geomagnetic activity. The equatorial magnetic field changes associated with passage of solar wind streams of different durations density spike and stream interfaces are computed. This reveals that the maximum field change is associated with the short duration streams. The diurnal asymmetry of the disturbance is least for the stream interface passage. However, a significant enhancement of the daily range is found to be associated with the diurnal asymmetry of the disturbance. (8 refs.)

121467 Pi 2 pulsations in the Indian equatorial region. T.S.Sastry, Y.S.Sarma, S.V.S.Sarma, P.V.S.Narayan (Nat. Geophys. Res. Inst., Hyderabad, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.77-80 (June 1983).
Well-defined waveforms and the dominance of H_x component are the general characteristic features of the Pi 2 pulsations in the equatorial regions. The authors, besides bringing out these features, also indicate some specific differences between the events appearing at widely separated stations in the Indian equatorial region. The study entails a comparison of Pi 2 events recorded at the two stations, Choutuppal (geomag. lat. 7° and Etaiyapuram geomag. lat. $-0.6°$) during 1976, the data being restricted to the events that occurred during nighttime (1800-0600 hrs LT). The results are suggestive of induction effects due to a subsurface conductivity anomaly in the neighbourhood of Etaiyapuram, besides possible effects due to the nearby coast. (12 refs.)

121468 Structure of the quasi-parallel bow shock: results of numerical simulations. J.R.Kan, D.W.Swift (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6919-25 (1 Sept. 1983).
Quasi-parallel bowshock structures are simulated by using a one-dimensional nonperiodic hybrid code in which the ion dynamics are treated exactly while the electron dynamics are omitted by neglecting the electron inertia ($m_e=0$) and pressure. The simulations are initialized with the upstream condition specified by $\theta_1=10°$, $\beta_1=0.5$, and $M_{A1}=2$ with 0.5 increment while the downstream condition is obtained from the Rankine-Hugoniot relations, where θ_1 is the angle between the shock normal and the magnetic field, β_1 is the ratio of kinetic to magnetic pressures, and M_{A1} is the Alfven Mach number. The simulations describe a number of phenomena including upstream and downstream waves, turbulent magnetic field structure, firehose instability effects and ion heat flux flowing upstream. (32 refs.)

121469 Numerical simulation of the dayside reconnection. M.Hoshino, A.Nishida (Inst. of Space. & Astron. Sci., Tokyo, Japan).
J. Geophys. Res. (USA), vol.88, no.A9, p.6926-36 (1 Sept. 1983).
To examine the basic characteristics of reconnection on the dayside magnetopause, the authors have numerically studied the reconnection process at an interface where the total pressure is in balance but where the thermal pressure is higher on one side than on the other. Reconnection is caused by anomalous resistivity that is assumed to operate only in a localized region at the interface. Boundaries are assumed to be free boundaries, but reflection of the perturbations originating from inside the simulation region is suppressed by placement of an absorbing region. Results can be expressed as follows, denoting the high-pressure and low-pressure regions as magnetosheath and magnetosphere, respectively. (1) a slow shock is formed in magnetosheath and a slow expansion fan is formed in magnetosphere; (2) at the slow shock the Lorentz force and pressure gradient are of comparable importance in accelerating plasma, but at the expansion fan the pressure gradient has the dominant effect. (12 refs.)

121470 Interaction of ring current ions with the magnetopause. M.Scholer (Inst. fur Extraterrestrische Phys., Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany), F.M.Ipavich.
J. Geophys. Res. (USA), vol.88, no.A9, p.6937-43 (1 Sept. 1983).
Phase space density observations of ring current protons (30-130 keV) have been analysed during a magnetopause crossing of ISEE 1 on July 5, 1978. Plasma and magnetic field data obtained during this crossing have been reported to be consistent with quasi-steady reconnection and a reconnection line south of the satellite crossing (Sonnerup et al. 1981). The authors find that within the magnetosphere the phase space densities of ~30- to ~65-keV protons are higher for particles streaming parallel to the field (i.e. inflowing particles) than antiparallel to the field (i.e. outward flowing particles). In the magnetosheath the phase space densities parallel to the field are higher than the densities of both outward and inward flowing particles parallel to the field within the magnetosphere. The observations are discussed in terms of acceleration of the reflected and transmitted ring current protons in the magnetopause current layer. (12 refs.)

121471 Low-energy (<100 eV) ion pitch angle distributions in the magnetosphere by ISEE 1. T.Nagai, J.F.E.Johnson, C.R.Chappell (Space Sci. Lab., NASA Marshall Space Flight Center, Huntsville, AL, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6944-60 (1 Sept. 1983).
Low-energy (<100 eV) ion data from the plasma composition experiment on ISEE 1 are examined statistically to study pitch angle distributions in all local times of the magnetosphere ($L=3$-10). The pitch angle distributions in the data set used can be classified into seven types; however, there are four major types, i.e. isotropic distribution, bi-directional field-aligned distribution, unidirectional field-aligned distribution, and low flux. The isotropic distribution that consists of very low energy (typically <10 eV) ions is a persistent feature in the inner region. It is frequently observed with an accompanying loss cone-like structure. (61 refs.)

121472 Self-consistent theory of three-dimensional convection in the geomagnetic tail. J.Birn, K.Schindler (Ruhr-Univ. Bochum, Bochum, Germany).
J. Geophys. Res. (USA), vol.88, no.A9, p.6969-80 (1 Sept. 1983).
The self-consistent theory of time-dependent convection in the Earth's magnetotail of Schindler and Birn (1982) is extended to three dimensions to include more realistic tail geometry and three-dimensional flow. It is confirmed that a steady state solution implies unrealistic tail geometry or large particle or energy losses that are unrealistic during quiet times. It is concluded therefore that as in the 2-dimensional case the magnetotail becomes time-dependent for typical convection electric fields. Explicit solutions are derived, even analytically, for the three-dimensional flow and the electric and magnetic field in a realistic tail geometry, and quantitative examples are presented. Consequences of time-dependent convection are demonstrated considering two idealized cases of magnetosphere response to solar wind changes. (14 refs.)

121473 Triggering of expansive phase intensifications of magnetospheric substorms by northward turnings of the interplanetary magnetic field. G.Rostoker (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Geophys. Res. (USA), vol.88, no.A9, p.6981-93 (1 Sept. 1983).
Over the past decade evidence has arisen suggesting that northward turnings of the interplanetary magnetic field after an interval of sustained southward IMF can trigger the onset of major substorm expansive phase effects. However, there has been some question in the past as to just how many substorms are triggered and whether, indeed, the correlation of substorm onsets and northward turnings was just a matter of chance. One reason for doubt was that the examples presented in the literature appeared during disturbed periods where the IMS was fluctuating significantly on a time scale of less than one hour and many substorm expansive phase intensifications were observable in the time frame where the correlation between the IMF and ground data was reported. The purpose of this paper is to present three clear-cut examples of isolated substorms where the reader may be able to convince himself of the validity of the reported triggering effect. (17 refs.)

121474 Development of substorm activity in multiple-onset substorms at synchronous orbit. T.Nagai (Space Sci. Lab., NASA Marshall Space Flight Center, Huntsville, AL, USA), D.N.Baker, P.R.Higbie.
J. Geophys. Res. (USA), vol.88, no.A9, p.6994-7004 (1 Sept. 1983).
The development of substorm activity at synchronous orbit (6.6 R_E) for multiple-onset substorms was studied by using the energetic particle and magnetic field data in three local time groups (the afternoon region, the premidnight region, and the postmidnight region). The geostationary spacecraft 1976-059 and 1977-007 provided the measurements of 30- to 2000-keV electrons and 145- to 560-keV protons, GMS the measurements of >2000 keV electrons, and GOES 1 and GOES 2 the measurements of the magnetic field. The ground magnetic variations in a wide area were examined to determine the general characteristics of substorm activity and the timing of various phenomena. The substorm evolutions showed a variety of forms at synchronous orbit. (32 refs.)

121475 Magnetospheric processes preceding the onset of an isolated substorm: a case study of the March 31, 1978, substorm. A.Nishida (Inst. of Space & Astron. Sci., Tokyo, Japan), Y.Kamide.
J. Geophys. Res. (USA), vol.88, no.A9, p.7005-14 (1 Sept. 1983).
Examines in detail the effect of a southward turning of the interplanetary magnetic field (IMF) on the state of the magnetosphere, taking advantage of the availability of the data from IMS magnetometer meridian chains and from several spacecraft. A clear onset substorm occurred on March 31, 1978, when the magnetometer stations were located in the midnight to morning sector and the spacecraft were near the equatorial plane of the nightside magnetosphere. The onset time of the substorm expansion phase could be determined unambiguously in terms of both ground-based magnetic and auroral signatures, and there was an interval lasting about 1 hour between the IMF southward turning and this onset. In this intervening interval the ionospheric current system of the DP 2 type developed. (20 refs.)

121476 Satellite observations of Pi 2 activity at synchronous orbit. T.Sakurai (Dept. of Engng., Tokai Univ., Hiratsuka, Japan).
J. Geophys. Res. (USA), vol.88, no.A9, p.7015-27 (1 Sept. 1983).
Pi 2 magnetic pulsations are frequently observed at synchronous orbit by the UCLA fluxgate magnetometer on ATS 6. Events that occurred in September 1974 have been studied by using digital power spectra and coherency analysis to determine wave characteristics. From examination of wave form and application of spectral analysis, these Pi 2 events can be divided into three types. The first is a superposition of a 100-s oscillation and a large-amplitude, higher-frequency Pi 1 activity. The second is a 100-s wave unaccompanied by Pi 1. Both types have a significant compressional component. The third is a pure transverse wave in the azimuthal component. The pure transverse waves are quite rare, while the compressional waves occur during almost every substorm. The local times of occurrence are studied. Pi 2 polarisations are also studied. (36 refs.)

121477 The localization of Pi 2 pulsations: ground-satellite observations. H.J.Singer, W.J.Hughes (Dept. of Astron., Boston Univ., Boston, MA, USA), P.F.Fougere, D.J.Knecht.
J. Geophys. Res. (USA), vol.88, no.A9, p.7029-36 (1 Sept. 1983).
Much of the attention given to Pi 2 pulsations has resulted from their close relationship with substorm onsets. With few observations in space there are problems in determining the extent of the pulsation region in the magnetosphere and in clarifying the substorm process from information contained in the Pi 2 signal. To further the understanding of Pi 2's and substorms, simultaneous Pi 2 observations from the ground, using the AFGL magnetometer network, and from space, using GOES 2 and 3 satellites, are presented. The observations indicate that the Pi 2 signal in space is often localized such that synchronous satellites separated by 30° see quite different field signatures. In contrast to this, on the ground and mid-latitudes, similar features are often observed across the 60° width of the AFGL magnetometer network. The results are interpreted in terms of the plasma sheet model. (44 refs.)

121478 Occurrence properties of ducted whistler-mode signals from the new VLF transmitter at Siple Station, Antarctica. D.L.Carpenter (Space Telecommunications & Radiosci. Lab., Stanford Univ., Stanford, CA, USA), Z.T.Bao.
J. Geophys. Res. (USA), vol.88, no.A9, p.7051-7 (1 Sept. 1983).
In 1979 a new VLF transmitter was installed at Siple Station, Antarctica ($L\sim4.3$) for the purpose of conducting magnetospheric wave-injection experiments. The transmitter, called Jupiter, is capable of operating at higher power (~7 dB) than the previous system, Zeus, and is also more flexible with respect to modulation. During the austral winter of 1980, signal receptions at the conjugate receiving station Roberval, Canada and in the two-hop mode at Siple itself were exceptional by comparison to data from previous years, both in terms of diurnal coverage and number of days of signal reception. One of the purposes of this paper is to describe and interpret the occurrence features of these data. Another purpose is to compare the occurrence rate of observed signals from Zeus with those from the higher-powered Jupiter system. (24 refs.)

121479 The distribution of auroral electrostatic shocks below 8000-km altitude. E.L.Bennett, M.Temerin, F.S.Mozer (Space Sci. Lab., Univ. of California, Berkeley, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7107-20 (1 Sept. 1983).
Examines the distributions and characteristics of electrostatic shocks as observed by the S3-3 polar-orbiting satellite. There is auroral oval coverage by the satellite at all magnetic local times and at all altitudes between 240 and 8000 km. Electrostatic shocks are reasonably uniformly distributed in magnetic local time, with a slight increase in the probability of occurrence in the cusp region and a decrease in the post-midnight region. The occurrence of shocks increases sharply with altitude up to 5000 km, and at a slower rate above 5000-km altitude. Larger shocks tend to occur above 5000-km altitude and between 16 to 22 hours magnetic local time. Electrostatic shocks occur in or near the latitudes of the auroral oval, with few shocks occurring inside the polar cap. The authors describe further occurrence statistics and relations. (29 refs.)

121480 Southern hemisphere cosmic-ray anisotropy at 10^{16} eV. P.R.Gerhardy, R.W.Clay (Phys. Dept., Univ. of Adelaide, Adelaide, Australia).
J. Phys. G (GB), vol.9, no.10, p.1279-87 (Oct. 1983).
Measurements have been made of the anisotropy of cosmic rays with energies of about 10^{16} eV from a Southern Hemisphere (latitude 35°S) site. A sidereal anisotropy with an amplitude of 0.84% and a phase of 8.0 h was found. This phase changes appreciably at about 10^{16} eV. (22 refs.)

121481 Distributed acceleration of cosmic rays. R.Silberberg, C.H.Tsao (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), J.R.Letaw, M.M.Shapiro.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1217-20 (26 Sept. 1983).
It is proposed that the acceleration of cosmic rays is distributed over their propagation through interstellar space. Thus after most nuclear fragmentation reactions in the interstellar medium, cosmic rays gain about a factor of 5 in energy. This hypothesis resolves several discrepancies in composition at different energies. The present results suggest that after the principal acceleration and during their galactic confinement, cosmic rays are further accelerated by the weak shocks of widely distributed old supernova remnants. (26 refs.)

121482 The effect of local perturbations of the geomagnetic field on cosmic ray cutoff rigidities at Jungfraujoch and Kiel. E.O.Fluckiger (Phys. Inst., Univ. Bern, Bern, Switzerland), D.F.Smart, M.A.Shea.
J. Geophys. Res. (USA), vol.88, no.A9, p.6961-8 (1 Sept. 1983).
The effect of local perturbations of the geomagnetic field on the vertical cosmic ray cutoff rigidities at Jungfraujoch and Kiel have been investigated as representative mid-latitude neutron monitor stations. The main, effective, and Stormer vertical cutoff rigidities and their changes were determined by utilizing the trajectory-tracing technique in a magnetic field which is modeled as a simple dipole field to which the disturbance field is superposed. It was found that the cosmic ray cutoff rigidities are most sensitive to variations of the z component of the geomagnetic field at geomagnetic latitudes $-20°<\Lambda<+30°$ and at longitudes within 90° to the east of these northern hemisphere stations. Furthermore, cutoff rigidity variations at Kiel are predominantly due to changes of the geomagnetic field within geocentric distances $2.5R_E<r<6R_E$, whereas at Jungfraujoch changes in cutoff rigidities are caused almost exclusively by magnetic disturbances within $1R_E<r<4.5R_E$. 121483 Mass composition of primary cosmic rays at energies 10^{14}-3×10^{15} eV. J.Kempa (Dept. of Phys., Univ. of Lodz, Lodz, Poland), J.Wdowczyk.
J. Phys. G (GB), vol.9, no.10, p.1271-7 (Oct. 1983).
The flux of hadrons at energies around 10^{13}-10^{14} eV measured by the Mount Fuji experiment has been compared with fluxes predicted for different assumptions about the mass composition of primary cosmic rays. It is shown that agreement between experimental data and prediction can be obtained only if the average mass of the primaries does not increase significantly up to a few times 10^{15} eV. It is concluded that the changes in the picture of cosmic-ray propagation, considered by some authors as due to enrichment of the primary flux by heavy-mass nuclei, have to be interpreted rather in terms of the interaction properties of high-energy hadrons. 94.40N Extensive air showers

121484 Is there a nonrandom component in high-energy cosmic rays?. G.R.Smith, M.Ogmen, E.Buller, S.Standil (Dept. of Phys., Univ. of Manitoba, Winnipeg, Canada).
Phys. Rev. D (USA), vol.28, no.7, p.1601-3 (1 Oct. 1983).
A search for a nonrandom component in the cosmic radiation has been conducted using a ground-based air-shower array sensitive to cosmic-ray primaries of energy $\gtrsim9\times10^{14}$ eV. The time interval between the detection of successive air showers has been measured for more than 156000 air showers recorded over a period of three years. The data are consistent with the conclusion that these primary particles are incident upon the upper atmosphere randomly in time and uniformly from all portions of the sky swept by the array. (10 refs.)

121485 Cosmic ray anisotropy derived from air showers ($10^{13}\sim10^{14}$ eV) observed in the southern hemisphere. K.Murakami, Z.Fujii, T.Yamada, S.Sakakibara.
Proc. Cosmic-Ray Res. Lab. Nagoya Univ. (Japan), vol.26, no.1, p.27-35 (Feb. 1983). In Japanese.
Reviews previous studies of cosmic ray anisotropy, examines the diurnal variation of cosmic rays in both hemispheres and presents results of measurements made at Liawenee, Tasmania, using 288 proportional counters covering an area 72 m^2 and sensitive to a primary median energy 5×10^{13}-10^{14} eV during the period 1981 Dec.-1982 June. (2 refs.) *M.J.C.*

121486 Study of some aspects of extensive air showers at sea level. M.J.Enderby.
Univ. Durham, England thesis, Dec. 1982
An experiment to search for tachyons, associated with extensive air showers, using an unshielded plastic scintillator is described. No evidence for their existence has been found. A review of tachyon theory and previous searches is given. The design and implementation of an automatic data collection system for the Durham Air Shower Array, using a PET microcomputer, is described. In addition various improvements to the array are described. The performance of the array and the methods of data analysis are discussed. The array has been operated with five detectors and the results compared to those expected by simulation. The power of the zenith angle distribution has been determined and found to correspond to previous determinations. The size spectrum has also been determined in the range 2×10^4 to 10^6 electrons. Although the slopes are in agreement with other measurements the absolute rate is low. It is concluded that this is mainly due to the lack of redundancy in the array and that more detectors are required.

121487 Vertical sea level muon spectra at super high energies calculated from the recent primary cosmic ray spectrum. D.P.Bhattacharyya, P.Pal (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Fizika (Yugoslavia), vol.15, no.3, p.283-97 (July-Sept. 1983).
The vertical sea level muon spectrum has been calculated from the recent primary cosmic ray spectrum. On assuming the validity of accelerator data in the fragmentation region for $x>0.1$ in the framework of Feynman scaling and using the meson atmospheric diffusion equation the authors have estimated the muon flux at first generation of parents from $pp\rightarrow\pi^{\pm}X$, $pp\rightarrow K^{\pm}X$, $\pi p\rightarrow\pi^{\pm}X$ inclusive reaction sources and second generation from $pp\rightarrow K^{\pm}X$ inclusive reaction increases with muon energy. The flux of muons for second generation and third generation for $pp\rightarrow\pi^{\pm}X$ inclusive reaction decreases with energy. The derived differential muon spectrum below 1 TeV is well in agreement with the direct magnetic spectrograph data of Holmes et al. (1961), Allkofer et al. (1971), Nandi and Sinha (1972), Ayre et al. (1975). (34 refs.)

121488 Muon component of extensive air showers. C.C.Shelley.
Univ. Nottingham, England thesis, 1982
The Haverah Park Air Shower Array detects and measures air showers initiated by primary cosmic rays with energies in excess of 5×10^{16} eV. The work presented in this thesis concerns the measurement of muon particle densities recorded by the three Nottingham University muon detectors for air showers in the energy range 10^{17} to 10^{18} eV. The muon density measurements were used to establish a muon lateral distribution function in the radial distance interval $80<r<700$ m. The muon lateral distribution function enabled fluctuations in the muon density to be measured. These results are compared with the results of model calculations. The conclusion drawn is that the primary cosmic ray flux is enriched by heavy nuclei. The average values of the muon density/deep water Cerenkov particle density are measured and

the fluctuation width determined. These data, when compared with model calculations, support the conclusion drawn from the muon density calculations. Fluctuations in muon density and muon/Cerenkov ratio are correlated with other air shower parameters measured at Haverah Park in an attempt to verify the relative development characteristics expected from model calculations.

121489 A determination of the electron density fluctuation spectrum in the solar wind, using the ISEE propagation experiment. L.M.Celnikier (Lab. d'Astronomie, Univ. Paris VI, Paris, France), C.C.Harvey, R.Jegou, M.Kemp, P.Moricet.
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.293-8 (Oct. 1983).
The ISEE propagation experiment is used to obtain a new determination of the electron density fluctuation spectrum in the free solar wind in the vicinity of the Earth. The preliminary analysis suggests that a single, Kolmogorov-type power law spectrum does not fit the data adequately over the entire range of distance scales covered by the experiment, which extends from about 10^2 km: the spectrum appears to flatten for wavelengths shorter than about 4000 km. (20 refs.)

121490 Electromagnetic lower hybrid waves in the solar wind. E.Marsch, T.Chang (Center for Space Res., MIT, Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6869-80 (1 Sept. 1983).
An analysis of electromagnetic lower hybrid waves or hybrid whistlers that propagate nearly perpendicular to the magnetic field lines in the solar wind is described. Doppler-shifted, these waves have a broadband nature when observed in the spacecraft frame depending on the direction of propagation and the supersonic flow velocity of the wind. Lower hybrid waves can energize ions normal to the interplanetary magnetic field. They may occasionally be responsible for the observed temperature anisotropy in high speed streams and possibly for the acceleration of heavier ions such as the oxygen ions, alpha particles, etc. These modes are probably driven unstable by the anisotropic halos of the solar wind electron distributions exhibiting 'heat flux' profiles. (42 refs.)

121491 Collisional modification to the exospheric theory of solar wind halo electron pitch angle distributions. D.S.Lemons, W.C.Feldman (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6881-7 (1 Sept. 1983).
A theoretical model of suprathermal halo or strahl solar wind electrons, including both binary collisions and conservative force fields, is proposed. From this model the collisionally modified electron pitch angle distribution is derived and compared with relevant measurements made in the solar wind at 1 AU by using the Los Alamos IMP 8 plasma analyzer. Although the collisionally modified distribution is more isotropic than that predicted by simple exospheric theory, it is not isotropic enough to describe the measurements. (14 refs.)

121492 Removal of velocity bias in the interpretation of measurements of the azimuthal component of the interplanetary magnetic field. M.Eyni, R.Steinitz (Dept. of Phys., Ben Gurion Univ., Beer Sheva, Israel).
J. Geophys. Res. (USA), vol.88, no.A9, p.7236-8 (1 Sept. 1983).
Parker's model for the interplanetary magnetic field predicts an r^{-1} dependence for the azimuthal component. Departures from this relation were indicated in an analysis of a subset of the Helios 1 data. As in a previous analysis of Pioneer 10 data, these departures can be traced to velocity bias. The present authors examine the decrease in solar wind speed which occurred as Helios 1 approached the Sun and thus simulated a steeper gradient of the azimuthal magnetic field component. A simple linear fit between flow speed and distance from the Sun enables the authors to remove from the data most of the velocity bias present. This procedure substantially improves the agreement between Parker's model and the Helios data. (15 refs.)

121493 Annual variation of number of days of the IMF polarity. K.Fujimoto, H.Kojima.
Proc. Cosmic-Ray Res. Lab. Nagoya Univ. (Japan), vol.26, no.1, p.1-11 (Feb. 1983). In Japanese.
Investigates the polarity changes of the interplanetary magnetic field during the period 1947-80 and examines the inclination and lag of the Earth's neutral sheet over three solar cycles. (5 refs.) *M.J.C.*

121494 Interplanetary plasma concentration measurements by use of dual frequencies from separated sites. T.A.Croft, W.A.Edson (SRI Internat., Menlo Park, CA, USA).
Radio Sci. (USA), vol.17, no.4, p.773-85 (July-Aug. 1982). [received: Oct. 1983]
Since 1965 the dual-frequency method has been used for measuring densities of plasmas near planets and in interplanetary space. Two markedly different sets of equipment have thus far been used to perform dual-frequency observations; their strengths and weaknesses are reviewed, and it is shown that many of the weaknesses could be overcome by using separate sites on the Earth from which to transmit the low and high frequencies. A survey of the expected error in measurements using separated sites suggests that the critical element if time synchronization between them. The best available device for performing this function is the cesium beam clock. (18 refs.)

121495 Solar-wind turbulence spectrum and velocity at elongations of 90-150°. V.P.Bovkun, I.N.Zhuk (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.513-18 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.727-33 (July 1982). [received: Sept. 1983]
Research results are presented on the energy spectra of scintillation on inhomogeneities of the interplanetary plasma and ionosphere in the decameter wavelength range. The possibility of separating them is demonstrated. The scintillation spectra of radio sources at 12.6-25 MHz have a power-law form with a spectral index of 3.1 ± 0.6 for interplanetary scintillations and 3.4 ± 0.5 for ionospheric scintillations. No significant drift of the cut frequency of the Fresnel filter was detected in observations of interplanetary scintillations of less than 2 h. The scatter of the instantaneous spectra is mainly due to random fluctuations. Significant drifts of the cut frequency of the Fresnel filter are observed in measurement sessions differing from each other by more than a day. An estimate of the effective solar wind speed of 300 ± 80 km/sec at elongations of 90-150°, which agrees well with the literature data, is obtained using the phase-screen model. (25 refs.)

121496 Nonequilibrium radiative heating of an ablating Jovian entry probe. S.N.Tiwari, S.V.Subramanian (Old Dominion Univ., Norfolk, VA, USA).
AIAA J. (USA), vol.21, no.9, p.1338-44 (Sept. 1983).
The influence of nonlocal thermodynamic equilibrium (NLTE) radiative transfer on the entire range of shock-layer flow phenomena around a Jovian entry body is investigated. The entry body considered is a 35 deg hyperboloid. The flow in the shock layer is assumed to be viscous, axisymmetric, laminar, and in chemical equilibrium. With coupled ablation carbon-phenolic injection, 16 chemical species are used in the ablation layer for radiation absorption. The NLTE radiative transfer and flux equations are expressed in terms of the NLTE source function, collisional relaxation time, and radiative lifetime. The NLTE results obtained for the peak-heating entry conditions are compared with corresponding equilibrium results. The results indicate that, in the presence of the ablative products, the radiative heating to the entry body is significantly higher under NLTE conditions. (23 refs.)

121497 High-accuracy orbit determination for spacecraft in low Earth orbits. J.M.Dow (Orbit Attitude Div., European Space Operations Centre, Darmstadt, Germany).
ESA Bull. (France), no.35, p.82-9 (Aug. 1983).
With the continuing development of high-precision tracking techniques for near-Earth orbiters (lasers, improved two-frequency microwave range and range-rate systems, satellite-to-satellite tracking, altimetry, plus water-vapour radiometers for correction of tropospheric delays), new standards of accuracy for orbit determination are becoming possible, at the level of decimetres or better. From global tracking of such orbiters many other parameters of geophysical interest in addition to the orbital parameters can be extracted from the tracking data, some examples being gravity coefficients, coordinates of networks of ground points, polar motion, Earth rotation, and tidal parameters. (no refs.)

121498 The future for communication satellites of the PAM-D/half Ariane class. U.Renner (ESA, ESTEC, Noordwijk, Netherlands).
Space Commun. & Broadcast. (Netherlands), vol.1, no.2, p.145-54 (July 1983).
There is a growing market for satellites of the so-called 'medium class' compatible with launch by Delta, Ariane, and the US Space Shuttle. The current market situation and main competing designs are reviewed and predictions made of the trend which can be seen for development of this class of satellites to meet future communication satellite market demands. (no refs.)

121499 Design evolution and economics of future communication satellite platforms. D.E.Koelle (Space Div., MBB-ERNO, Ottobrunn, Germany).
Space Commun. & Broadcast. (Netherlands), vol.1, no.2, p.155-72 (July 1983).
The author first analyzes the trend in the past 20 years regarding communication satellite mass, capacity and number and extrapolates the future trends for European satellite services. Secondly, the author deals with the impact of launch vehicle constraints and requirements on communication satellite design (mass, volume, diameter) and compares different transfer modes LEO*→GEO* in terms of performance and cost efficiency. An assessment of future communication satellite/platform concepts is made, introducing a mass classification and basic spacecraft 'generations'. The different types of conventional spacecraft, platforms with integrated transfer propulsion, modular platform assemblies and large telecom stations are discussed. Finally, the author looks at spacecraft and launch cost, showing the impact of size on cost. Larger, high-capacity systems tend to lower specific cost per channel, promising overall programmatic criteria. (5 refs.)

121500 Trends in propulsion systems for communications satellites. D.E.Fritz (Subsystem Engng. Section, TRW Space & Technol. Group, Redondo Beach, CA, USA), R.L.Sackheim, H.Macklis.
Space Commun. & Broadcast. (Netherlands), vol.1, no.2, p.173-88 (July 1983).
Communications satellite propulsion system performance has been improving steadily for some time. This trend is occurring both for orbit injection propulsion systems and on-orbit attitude and velocity control systems. For injection functions, emphasis has been on higher performance solids with specific impulse values exceeding 300 s, as well as integral liquid systems offering I_{sp} values greater than 310 s. Improved performance for solids is being achieved through use of higher energy propellants and extendable, higher area ratio nozzles. Liquid apogee motors using nitrogen tetroxide (N_2O_4) as oxidizer and monomethylhydrazine (MMH) as fuel are already performing well on the current generation of satellites. On-orbit attitude control systems have progressed through cold gas to monopropellant hydrogen peroxide, to catalytic monopropellant hydrazine. Current satellites achieve weight savings through use of electrothermally augmented hydrazine thrusters for north-south station keeping or all storable bipropellant systems for both velocity and attitude control. The authors describe recent trends in propulsion system designs for near-term and future communication satellites. (5 refs.)

121501 The ITALSAT programme. F.Marconicchio, F.Valdoni (Consiglio Nazionale Richerche, Rome, Italy).
Space Commun. & Broadcast. (Netherlands), vol.1, no.2, p.199-204 (July 1983).
Describes the experimental and pre operational Italsat Programme which has been conceived to prepare for implementation of a subsequent operational Italian domestic system. Such a system is expected to play an important role

in the evolution of an Italian Integrated Services Digital Network (ISDN). (no refs.)

121503 **Satellite orbital precession caused by a rotating oblate atmosphere with a diurnal variation in density.** W.J.Boulton (Dept. of Maths., Univ. of Aston, Birmingham, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.349-67 (8 Oct. 1983).
The effect of the motion of the upper atmosphere on satellite orbits of small eccentricity, $e<0.2$, is considered. The atmospheric model allows for oblateness, and has a density profile that approximates to the observed day-to-night variation. The equations governing the changes due to zonal (west-to-east) and meridional (south-to-north) winds in the right ascension of the ascending node of the orbital plane Ω during one anomalistic period of the satellite are integrated, assuming that H, the density scale-height, is constant. The resulting expressions for $\Delta\Omega_w$, due to zonal winds, and $\Delta\Omega_{\Phi}$, due to meridional winds, are given. It is shown that there can be appreciable changes in $\Delta\Omega/\Delta T_D$, where ΔT_D is the corresponding change in orbital period, that persist for several months for certain resonant orbits if the diurnal variation in density is allowed for. Compact expressions for $\Delta\Omega$ and $\Delta\Omega/\Delta T_D$ are given when H varies linearly with height. It is demonstrated that in general there is no constant value of H that gives an exact equivalence between the variable-H and constant-H equations in the presence of a diurnal density variation. (29 refs.)

121504 **The advance of the perigee of a satellite in a rotating oblate atmosphere with a diurnal variation in density.** W.J.Boulton (Dept. of Maths., Univ. of Aston, Birmingham, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.433-44 (8 Oct. 1983).
The effect of air drag on satellite orbits of small eccentricity, $0.01 \lesssim e \lesssim 0.2$, is considered. A model of the atmosphere that allows for oblateness, and in which the density behaviour approximates to the observed diurnal variation, is adopted. The equation governing the changes due to drag in the argument of perigee ω, during one revolution of the satellite, is integrated with the assumption that the density scale height H is constant. The resulting expression for $e\Delta\omega$ is presented to third order in e. Compact expressions for $e\Delta\omega$ and $e\Delta\omega/\Delta T_D$, where ΔT_D is the corresponding change in the period, are obtained when H is allowed to vary with altitude. It is shown that there is an equivalence between the variable-H and the constant-H equations, provided that the value of H used in the latter is chosen appropriately. (31 refs.)

121505 **Pulse-to-pulse correlation in satellite radar altimeters.** E.J.Walsh (NASA Wallops Flight Center, Wallops Island, VA, USA).
Radio Sci. (USA), vol.17, no.4, p.786-800 (July-Aug. 1982). [received: Oct. 1983]
Pulse-to-pulse correlation in satellite radar altimeters is examined to determine if range jitter in future altimeters could be reduced by increasing the pulse repetition frequency (PRF). Data from the Skylab radar altimeter range tracker configurations are reviewed and a simple curve is developed for the PRF below which decorrelation is assured. An adaptive PRF for future altimeters is recommended to conserve mission power while optimizing data collection during high-sea states. (21 refs.)

121506 **Introduction to Hinotori.** Y.Tanaka (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.3-6 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The Hinotori mission is dedicated to solar flare observations mainly in the X-ray energy band. The instruments on board conduct (1) hard X-ray imaging of solar flares by means of rotating modulation collimators, (2) wide energy band spectroscopy in the range from 2 keV to several MeV as well as (3) high resolution crystal spectroscopy of iron emission lines. Several hundred flares have been recorded and analyses are under way. A description of Hinotori and the characteristics of the instruments are presented. (2 refs.)

121507 **Solar instruments on the P78-1 spacecraft.** G.A.Doschek (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.9-17 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The solar experiment package on the P78-1 spacecraft is described. The satellite was launched on 24 February 1979 by the US Air Force and contains high resolution Bragg crystal spectrometers, hard X-ray proportional counters, and a white light coronagraph. The high resolution spectrometers were built by the Aerospace Corporation and the Naval Research Laboratory. The hard X-ray spectrometers were built by the Aerospace Corporation and the white light coronagraph was supplied by the Naval Research Laboratory. Most of these instruments are still returning data. 121509 **Further studies on criteria for the onset of dynamical instability in general three-body systems.** Y.J.Pendleton, D.C.Black (Space Sci. Div., NASA Ames Res. Center, Moffett Field, CA, USA).
Astron. J. (USA), vol.88, no.9, p.1415-19 (Sept. 1983).
Results are presented from a variety of numerical experiments designed to further elucidate conditions under which self-gravitating three-body systems become dynamically unstable. The authors examined the stability of four types of orbital configurations: (1) circular, prograde, and coplanar orbits, (2) circular, retrograde, and coplanar orbits, (3) circular, direct, and inclined orbits, and (4) eccentric, direct, and coplanar orbits. Experiments with circular, prograde, and coplanar orbits corroborate the stability criterion proposed by Graziani and Black (1981) as well as the generalized form of that criterion proposed by Black (1982). Experiments with retrograd orbits were limited to systems where the tertiary body was significantly less massive than the binary bodies and in orbit about the binary as a whole (the so-called 'outer planet' configuration). These retrograde systems are less stable than their prograde counterparts. Results indicate that orbital inclination does not significantly affect stability for 'outer planet' configurations, but that the stability of 'inner planet' configurations, where the tertiary is in close orbit about one member of the binary, is noticeably less so once the relative orbital inclination >50°. The authors find that the onset of dynamical instability is only weakly dependent on the eccentricity of either the binary or tertiary orbit as long as the mass of tertiary is comparable to the reduced mass of the binary. However, the dynamical stability of systems in which the tertiary mass is either much greater or much less than the reduced mass of the binary is a relatively strong function of orbital eccentricity. (11 refs.)

121510 **Determination of minimum distance between orbits of celestial bodies.** Yu.G.Babenko.
Astrometriya & Astrofiz. (USSR), no.49, p.22-6 (1983). In Russian.
A method is suggested for determination of the minimum distance between an elliptic orbit and that of an arbitrary type. The method is based on finding all the singular points of the mutual distance function. (2 refs.)

121511 **The secular accelerations in Gylden's problem.** A.Deprit (NBS, Washington, DC, USA).
Celestial Mech. (Netherlands), vol.31, no.1, p.1-22 (Sept. 1983).
In a two body-problem, any type of variation in time of the Keplerian parameter μ (product of the constant of gravitation G by the reduced mass m) causes a mean secular acceleration in the mean anomaly, but leaves the mean argument of perigee stationary. All asymptotic estimates for mean marginal rates of variation in the osculating elements, that Vinti (1974, 1977) established in the case when G is inversely proportional to the time, are now extended to the most general kind of Gylden systems, and made into exact relations. The role of a Gylden system in explaining the marginal acceleration in the Moon's mean motion is clarified. In addition, separable Gylden systems

are classified from a physical standpoint by the integrals that they admit. (59 refs.)

121512 Motion near quadruple collision in the trapezoidal 4-body problem. E.A.Lacomba (Dept. of Math., Univ. Autonoma Metropolitana, Mexico City, Mexico).
Celestial Mech. (Netherlands), vol.31, no.1, p.23-41 (Sept. 1983). In French.
Continues the study of the trapezoidal 4-body problem, started by (Lacomba, 1981). The dimensions and interconnections of the invariant submanifolds of the equilibrium points in the total collision manifold are studied. The author concludes with the description of some important motions in the problem. The problem is roughly as hard as the zero angular momentum plane 3-body. The principal features of this problem are the nonexistence of triple collisions and the embedding of two simpler problems with one less degree of freedom: the rectilinear trapezoidal, and the retangular problems (the last one only if $\mu=m$). As usual, there are some bifurcations for some values of the mass ratio. They change some of the interconnections. (6 refs.)

121513 Determination of autonomous three-dimensional force fields from a two-parameter family of orbits. G.Bozis (Dept. of Theoretical Mech., Univ. of Thessaloniki, Thesaloniki, Greece).
Celestial Mech. (Netherlands), vol.31, no.1, p.43-51 (Sept. 1983).
Any two of the components X, Y, and Z of an autonomous force field which gives rise to the space orbits $F(x, y, z)=c_1$, $G(x, y, z)=c_2$ are related by a partial differential equation with coefficients depending on the functions F and G. This is a generalization of the corresponding equation for planar orbits (Bozis, 1983). The above partial differential equation is accompanied by the algebraic linear equation in X, Y, and Z expressing the fact that the force vector is lying in the osculating plane at each point of the orbit. The two equations constitute a generalization of the corresponding Szebehely's equations in the three dimensional space (Erdi, 1982). The generalization is meant in the sense that the dynamical system is not necessarily assumed to be conservative. (5 refs.)

121514 Regularization and linearization of the equations of motion in central force-fields. R.Cid, S.Ferrer, A.Elipe (Dept. de Astron., Univ. de Zaragoza, Zaragoza, Spain).
Celestial Mech. (Netherlands), vol.31, no.1, p.73-80 (Sept. 1983).
With the framework of linear and regular celestial mechanics, wide class of central force field problems are considered. The authors take as potential function a polynomial whose variable is the reciprocal of the distance from the origin, and, as regularizing function the square root of a certain reciprocal polynomial, related to the potential function. The relations between the coefficients of both functions, in order to arrive to linear equations, are given. In particular, the case of a quintic polynomial is analyzed, and an application is made to artificial Earth satellites considering harmonics J_2, J_3, J_4. (11 refs.)

121515 Families of spatial periodic orbits of the Hill problem and their stability. M.L.Lidov, V.A.Lyakhova.
Cosmic Res. (USA), vol.21, no.1, p.1-9 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.3-11 (Jan.-Feb. 1983). [received: Sept. 1983]
The results of a numerical determination of the parameters of the families $\mathscr{L}_0$ of spatial periodic orbits of the Hill problem are presented. The families $\mathscr{L}_0$ are generated by certain one-dimensional periodic orbits forming the family $\mathscr{B}_0$. A test particle on the orbits of $\mathscr{B}_0$ moves along a segment of the axis normal to the plane of the orbit of the main bodies. (3 refs.)

121516 Systems of synchronous artificial satellites in stable circular orbits. M.A.Vashkov'yak, M.L.Lidov.
Cosmic Res. (USA), vol.21, no.1, p.9-15 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.12-19 (Jan.-Feb. 1983). [received: Sept. 1983]
Discusses the problem of determining the initial parameters of the motion of a system of satellites in almost-circular, synchronous orbits which ensure that both the path of the Earth's surface and the angular distance between any pair of satellites are stable. Examples of such systems, consisting of systems of three satellites in orbits with initial inclinations $i\approx48$ and 43°, and their stability over a 5-yr period of time are studied. (5 refs.)

121517 Application of time reversal invariance to numerical experiments of many body systems: case of Campbell-Henon model. K.Aizu (Dept. of Phys., Rikkyo Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.106-18 (July 1983).
The accuracy of numerical experiments in many body systems is examined with the aid of the time reversal invariance. As an example the case of self-gravitating, spherically symmetric system—Campbell-Henon model—is studied. The author compares the initial values of radius and velocity of each particle with the final ones obtained at the end of time-reversed process under different parameters. In typical cases the accuracy rapidly diminishes 8-fold compared to the dynamical time. The method is used to select optimum values of parameters for numerical computations. (6 refs.)

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

121518 The limits to the cross-section for magnetic monopole creation obtained from the persistence of the magnetic field of white dwarfs. A.K.Drukier (Dept. of Nuclear Medicine, Tech. Univ. Munich, Munich, Germany).
Acta Astron. (Poland), vol.33, no.1, p.127-39 (1983).
The persistence of magnetic fields of white dwarfs suggests that the monopoles with $m_g \leq 4\times10^3$ GeV/c are either nonexistent or 'composite', i.e. that their production is much suppressed. (38 refs.)

121519 Propagation of high frequency waves in strongly magnetized plasmas. Mode ambiguities due to vacuum polarization. M.Soffel, J.Ventura, H.Herold, H.Ruder, W.Nagel (Lehrstuhl fur Theoretische Astrophys., Univ. Tubingen, Tubingen, Germany).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.251-9 (Oct. 1983).
The question of normal mode orthogonality for hot strongly magnetized plasmas, as they might occur in the accretion column of X-ray pulsars, is reexamined. The problem of complete non-orthogonality of the modes ('mode collapse') that may occur near the cyclotron resonance and in the region where the plasma goes from being plasma to vacuum dominated is discussed in detail. Consequences for radiative transport calculations are mentioned. The occurrence of mode collapse in the vicinity of atomic resonances is briefly discussed. (25 refs.)

121520 The statistical behaviour of normalized Stokes parameters. D.Clarke, B.G.Stewart, H.E.Schwarz, A.Brooks (Univ. Obs., Glasgow, Scotland).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.260-4 (Oct. 1983).
It is demonstrated that because of noise, the distribution of repeated measurements of normalized Stokes parameters is not normal, generally exhibiting both skewness and kurtosis with the former possibly introducing systematic errors in the determination of mean values. In the limiting case for which the accuracy of the measurements is controlled by the noise of photon counting statistics, it is shown that the distribution, although symmetric, suffers positive kurtosis. However, except for circumstances which provide low photon counts per sample, the differences from normality are small, hardly affecting the standard determination of confidence intervals. Attention is also drawn to the diversity of ways by which normalized Stokes parameters are calculated. (14 refs.)

121521 Transfer of L_α-radiation in optically thick media. V.V.Zharkova.
Astrometriya & Astrofiz. (USSR), no.49, p.32-9 (1983). In Russian.
L_α-radiation transfer is considered in chromospheric formations of large optical thickness. The transfer equation in L_α line is solved within the framework of the plane-parallel geometry and two-level hydrogen atom. Different physical parameters of the model are considered. Line of sight distributions for the excitation degree of the second level n_2/n_1 and the L_α-profiles are obtained. (16 refs.)

121522 Dynamo generation of magnetic fields in three-dimensional space: solar cycle main flux tube formation and reversals. H.Yoshimura (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.363-85 (Aug. 1983).
Dynamo processes as a magnetic field generation mechanism in astrophysics can be described essentially by movement and deformation of magnetic field lines due to plasma fluid motions. A basic element of the processes is a kinematic problem. The author investigates the case of the solar magnetic cycle. A simple combination of differential rotation and global convection, given by a linear analysis of fluid dynamics in a rotating sphere, can perpetually create and reverse great magnetic flux tubes encircling the Sun. This shows that magnetic field generation by fluid motions is, in fact, possible and that MHD equations have a new type of oscillatory solution. The solar cycle can be identified with one such oscillatory solution. (80 refs.)

121523 Electron excitation rates among fine structure levels in O III. K.M.Aggarwal (Dept. of Appl. Maths. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.387-98 (Aug. 1983).
Electron collision strengths have been calculated for 146 transitions among the fine-structure levels in O III using a suitable transformation of *LS* coupling reactance matrix elements computed with the *R*-matrix method. These have been obtained at a fine energy grid in an energy region below 5.16 Ry and are found to be varying with electron energy, exhibiting a complicated resonance structure in almost the entire energy range. These have been averaged over a Maxwellian distribution of electron energies to get the effective collision strengths which are very simply related to the excitation and the de-excitation rate coefficients. The results are tabulated for temperatures below 60000K. (17 refs.)

121524 The emission spectrum of yttrium monoxide: new rotational and vibrational results on the $A^2\Pi$-$X^2\Sigma^+$ system. A.Bernard, R.Gravina (Obs. de Lyon, Univ. Claude Bernard, Lyon, France).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.443-50 (Aug. 1983).
Rotational analyses have been extended to the emission spectra of several more bands in the $\Delta v=0,-1$ sequences of the $A^2\Pi$-$X^2\Sigma^+$ system of yttrium monoxide, excited in the discharge of a hollow cathode tube. The study is now completed for 18 bands, including the six $\Delta v=0$ bands already analyzed from Fourier transform spectroscopy. Accurate positions for 69 band heads are given, 12 of which principally in the $\Delta v=-1$ sequence (up to the 22-23 band) have been observed for the first time. A consistent set of accurate rotational and vibrational constants is obtained for both states, up to $v''=10$ and $v'=9$, from global band fittings, v-connected bands being simultaneously treated. (19 refs.)

121525 Liquid-gas phase transition in nuclear matter. P.J.Siemens (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Nature (GB), vol.305, no.5933, p.410-12 (29 Sept. 1983).
In supernovae, in the crucial moments when the implosion is reversed to an explosion, densities comparable to those of neutron stars may be attained with associated temperatures of 5 to 10 MeV. An accurate knowledge of the properties of nuclear matter under these conditions is essential to the understanding of supernova dynamics. This communication shows how laboratory observations with the latest generation of nuclear accelerators can be used to infer the surface tension of the liquid-gas interface in nuclear matter—an essential ingredient of the equation of state for which a reliable theoretical model is not available. (16 refs.)

121526 The Sun's quadrupole moment and perihelion precession of Mercury. L.Campbell, J.C.McDow, J.W.Moffat, D.Vincent (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Nature (GB), vol.305, no.5934, p.508-10 (6 Oct. 1983).
The interior rotation of the Sun is determined from rotational splittings of global oscillations of the Sun. The angular velocity distribution yields the

minimum quadrupole moment coefficient $J_2=1.6\times10^{-6}$. A physical angular velocity distribution will produce a larger J_2 of the order of 5.0×10^{-6}. These results are compared with general relativity and the nonsymmetric theory of gravitation. For $J_2=5.0\times10^{-6}$ it is found that using the radar tracking data for the orbits of Mercury and the minor planet Icarus, general relativity disagrees with the data by $\approx 2^1/_4$ standard deviations. The nonsymmetric gravitational theory can fit all the Solar System data, including the orbits of Mercury and Icarus, if the new post-Newtonian parameter $l_\odot=3.1\times10^3$ km. (20 refs.)

121527 High resolution ultra-violet observations of alpha Lyrae using the University College London balloon-borne telescope system. B.Y.Welsh, A.Boksenberg, B.Anderson, W.A.Towlson (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.335-40 (Oct. 1983).
Spectral observations at a resolution of 8 km s^{-1} covering the region 2000-3200 Å have been made of the bright star α Lyrae (Vega) using the University College London Balloon-borne Ultraviolet Telescope and Image-tube Spectrograph. The authors report on the in-flight instrument performance and in particular the sensitivity and resolution of the system are discussed. Three important aspects of the present stellar data in the spectral region 2588-3135 Å are presented and these balloon results are subsequently compared and contrasted with other published data for this star. (22 refs.)

121528 An axial meridian circle. G.I.Pinigin, O.E.Shornikov.
Astrometriya & Astrofiz. (USSR), no.49, p.75-82 (1983). In Russian.
A description is given of a new design of the axial horizontal meridian circle. The instrument constants are controlled continually by means of the marks in the prime vertical. A method of stellar coordinates determination is elaborated. (10 refs.)

121529 25-M optical telescope with a mosaic main mirror. N.V.Stechenko.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.170-5 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.161-5 (1981). [received: Oct. 1983]
The design of a 25-m optical telescope with a mosaic main mirror is discussed. The telescope can consist of about 500 sitall mirrors, each 1.2 m in diameter, that are automatically controlled and produce a single image with energy concentration 70-80% within a spot 0.4-0.5 inch in diameter. The assembly of the telescope is briefly described. (10 refs.)

121530 Possible optical design of a telescope with a spherical main mirror 20-24 m in diameter. B.A.Burnasheva, R.E.Gershberg, V.I.Pronik, N.V.Steshenko.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.176-81 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.166-70 (1981). [received: Oct. 1983]
The attainment of high-quality image ($\sim1''$) in the $1'$ field of a two-mirror optical telescope with a spherical main mirror is discussed. It is shown that, in principle, this problem can be solved by introducing a secondary mirror in the form of a convex oblate spheroid or a slightly more complicated shape. Image sizes calculated by the ray-tracing method are reported for systems in which the main mirror has a large relative aperture. For next generation large telescopes with equivalent mirror diameter of 20-25 m, this optical system has considerable advantages as compared with the Cassegrain or Gregorian arrangements. (4 refs.)

121531 examination of concave and convex aspherical mirrors with a T-shaped spherometer. R.E.Gershberg, V.I.Pronik.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.182-93 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.171-9 (1981). [received: Oct. 1983]
The SFERA program is used to compute the data necessary for the fabrication and testing of astronomical mirrors, including the precise mirror figure, its deviation from the initial sphere, the sagittals of this figure for different mountings of the T-shaped spherometer on the surface, and the corresponding radii of the contacting spheres. The basic relationships for the program are introduced. The program can cope with both convex and concave mirrors with surfaces of the second or higher degree. (5 refs.)

121532 Deposition of new reflecting layers on mirrors during extra-atmospheric experiments. A.V.Bruns.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.216-23 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.197-203 (1981). [received: Oct. 1983]
It is suggested that the reflecting properties of mirrors in optical devices used for extra-atmospheric measurements can be restored by depositing reflecting coatings during the operation of these devices in satellite orbits. A simple graphoanalytic method is put forward for calculating the thickness of the deposited layer when several individual evaporators are employed. (5 refs.)

121533 Resolution in astronomy. D.S.Brown (NEI Grubb Parsons, Walkergate, Newcastle-upon-Tyne, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.290-3 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Reviews the resolution currently obtainable at wavelengths shorter than 100 μm and examines the extent to which improved resolution could be obtained with only modest extensions of current technology. The review is confined to consideration of telescope resolution and does not include the performance of detectors. (no refs.)

121534 Regularities in signal and noise producing processes typical for all pickup tubes of image orthicon class. N.D.Galinskii.
Astrometriya & Astrofiz. (USSR), no.49, p.82-8 (1983). In Russian.
Processes of build-up and readout of the charge pattern on the target in all tubes of image orthicon type (image orthicon, isocon and anti-isocon) can be regarded as successive charging or target capacity during storage and discharging of it during readout. Then peak-to-peak voltage only gradually approximates the steady state. At not too high light levels the frame number required for achieving the steady state appears to be much more than one. This determines the lag of this kind of tube but simultaneously explains the fact that in the case of viewing stationary or slowly moving scenes prereading noise does not achieve the output of the tubes, and the signal-to-noise ratio is determined only by the noise of the useful contribution of the return beam current. (12 refs.)

121535 Test runs on the five-channel spectrophotometer on the AZT-8 telescope. A.B.Bukach.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.224-34 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.204-15 (1981). [received: Oct. 1983]
Field runs have been carried out on the five-channel spectrophotometer with the aim of determining experimental uncertainties and the constancy of the instrumental characteristics in routine operations on a telescope. Extensive experimental data were used to determine the average temperature coefficient of the instrument as a whole. Trial runs have been carried out on a number of stars. Twenty scans recorded at different times and for different temperatures showed that data on stellar spectra, corrected for the temperature coefficient, could be obtained to within better than 1%, and the wavelength could be determined to within 3.5 Å. (11 refs.)

121536 Adaptive optical system for astronomical applications. F.Merkle, J.Bille, K.Freischlad, M.Frieben, G.Jahn, H.-L.Reischmann (Inst. of Appl. Phys. I, Univ. of Heidelberg, Heidelberg, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.294-302 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
An active mirror was developed which consists of an electrostatically deformable membrane. The polymer foil is actuated by an electrode array with 63 hexagonal elements arranged in a ring structure. With multi-microprocessor control the stabilisation of the star-speckle pattern positions and the deconvolution of the speckle patterns are possible. Two control methods are in development. One is working with a modified shearing interferometer as a wave-front sensor and a feed-back with cross-talk compensation. The other is sensing the optical information in the image plane by a diode-array and computing the wave-front from its Fourier modulus. The system presented is designed for the 0.75 m RC-telescope with alt-azimuth mount at the Landessternwarte in Heidelberg. (10 refs.)

121537 The CCD camera: a revolutionary new astronomical detector. T.C.Weekes (Mt. Hopkins Obs., Amado, AZ, USA).
Irish Astron. J., vol.15, no.4, p.271-80 (Sept. 1982). [received: Sept. 1983] (Proceedings of the Meeting of the Astronomical Science Group of Ireland, Belfast, Northern Ireland, 15 Dec. 1981).
The principle of the CCD detector is discussed, together with its use in astronomy. The advantages and disadvantages are discussed. (no refs.)

Computation of the profile of a surface accurately corrected for spherical aberration on the axis in a centered optical system ......See Entry 121538

95.70 OTHER INSTRUMENTATION AND TECHNIQUES

(inc. clocks, frequency standards)

121538 Computation of the profile of a surface accurately corrected for spherical aberration on the axis in a centered optical system. G.M.Popov.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.194-204 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.180-8 (1981). [received: Oct. 1983]
Simple and rigorous formulas are reported for the profile of the last surface, corrected for spherical abration, on the axis of an arbitary centred optical system. The method used to compute the aspherical surface located in the interior of the system and correcting its spherical aberration is described. A

simple procedure for determining the coma of the system is described and a method is given for correcting it in a special case. Examples are presented of the design of a fast objective of a coronograph and a spectrograph, based on these methods. (6 refs.)

121539 Correction of spherochromatism in Schmidt cameras. R.G.Bingham (Royal Greenwich Obs., Hailsham, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.303-10 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Describes the use of a negative vertex power of chromatic aberration at the corrector, which induces a compensating spherochromatism by changing the incidence height at the mirror surface. Various other aberrations can be corrected. Examples include a solid camera for use with a charge-coupled device as detector in a spectrometer. (8 refs.)

121540 Spot sensitometer for astronomical use. R.P.Edwin (Dept. of Astron. & Astrophys., Univ. of St. Andrews, St. Andrews, Fife, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.311-14 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A sensitometer has been commissioned for the photometric calibration of spectroscopic and wide field astronomical plates. A set of illuminated apertures of various diameters illuminate a corresponding set of apertures all of equal diameter located immediately in front of emulsions. Twenty calibration spots in irradiance steps of 1.27 are exposed on to each plate. Burr-free apertures of precise diameter were photo-etched in thin foil. During periodic calibrations, a fibre-optic feed system is coupled to a photon counting photomultiplier. The instrument is spectrally neutral and spot irradiance ratios are calibrated to within 1%. (6 refs.)

121541 Cosmic ray data transmission using the if-800 personal computer system. H.Ueno, M.Orito, T.Yamada.
Proc. Cosmic-Ray Res. Lab. Nagoya Univ. (Japan), vol.26, no.1, p.37-71 (Feb. 1983). In Japanese.
Describes the design of a data transmission system using two linked minicomputers, an if-800-10 and an if-800-20, connected by modems. Flow charts and BASIC programs listings are provided and the data presentation is explained using cosmic ray intensity data from the Sakashita Underground Observatory processed at Nagoya. 95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

121542 Automated photographic photometry of stars in globular clusters. R.Buonanno, G.Buscema, C.E.Corsi, I.Ferraro, G.Iannicola (Osservatorio Astronomico su Monte Mario, Roma, Italy).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.278-82 (Oct. 1983).
An automatic method for stellar photometry in crowded fields is presented. The reduction procedure, based on a multicomponent fitting routine, applies to PDS scans of a photographic plate and gives accurate magnitudes of all the objects with a detectable maximum (the estimated internal error is $\sigma \simeq 0.02$ m). The extended objects (galaxies or extremely blended stellar images) are recognized and passed to an interactive procedure. An application to the photometry of 2344 stars in the field of the globular cluster NGC 2808 is also shown. (17 refs.)

121543 Efficient methods to calculate Chandrasekhar's *H*-functions. P.B.Bosma, W.A.de Rooij (Dept. of Phys. & Astron., Free Univ., Amsterdam, Netherlands).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.283-92 (Oct. 1983).
Three iterative methods are proposed to determine the scalar H-functions for nonnegative characteristic functions $\psi(x)$ fulfilling the condition $\int_0 \psi(x)dx \leq {}^1/_2$. The methods are based on the use of the equation $1/H(\mu)=(1-2\psi_0)^{1/2}+\int_0^1[x\psi(x)H(x)]/(\mu+x)d$ x derived by Chandrasekhar. The authors prove that this equation allows two solutions, one being entirely positive—the physically relevant solution—and the other one being entirely negative. This distinct separation of the solutions ensures the uniqueness of the results. For isotropic scattering, linearly anisotropic scattering and Rayleigh scattering the authors present H-functions and some of their moments in 11 significant figures for 6 values of the albedo for single scattering, including the case of conservative scattering. (18 refs.)

121544 On the possibility of applying undense reference star frames to determining the optical positions of extragalactic radio sources. P.F.Lazopenko.
Astrometriya & Astrofiz. (USSR), no.49, p.10-12 (1983). In Russian.
The author considers a method for the determination of plate constants using two reference star frames, AGK3 and $n \approx 3$ nearest to the radio source stars with positions in the FK4 system within an accuracy of $\sigma_f = 0.08''$. By tying the secondary reference star frame and the FK4 system, an accuracy of about $\sigma_f/\sqrt{n} \approx 0.05''$ can be achieved. (5 refs.)

121545 Computation of polarization parameters of systems by the symbolic method. D.N.Rahckovskii, V.I.Abramenko, L.I.Tsvetkov.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.205-15 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.189-96 (1981). [received: Oct. 1983]
The matrix formalism for the transformation of the parameters of polarized radiation is used as a basis for a program algorithm for the computation of the characteristics of polarimetric systems. The symbolic notation introduced into the program is transformed into a specific matrix expression for various modulation frequencies, which are then computed. The procedure has been used to analyze the operation of radio-frequency polarimeters for the centimeter range, used in observations with a RT-22 telescope at the Crimean Astrophysical Observatory of the USSR Acadamy of Sciences. (6 refs.)

121546 Acousto-optic filters in astronomical spectrophotometry. B.Bates, D.Findlay, D.Halliwell (Dept. of Pure & Appl. Phys., Queens' Univ. of Belfast, Belfast, N Ireland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.315-18 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Acousto-optic filters possess some attractive properties for applications to astronomical spectrophotometry. Tuning over a wide spectral range is achieved by variation of the frequency of an acoustic wave propagated through the crystal which causes diffraction of the incident collimated light in a narrow range of wavelengths. Spectral scanning either continuously through the spectrum or by switching to a programmed set of wavelengths can be accomplished easily and rapidly since there are no moving parts. Spectral performance characteristics of a commercially available filter are given and an outline is presented of a prototype astronomical spectrometer which is controlled by a microcomputer. (8 refs.)

121547 A method for the identification and elimination of contamination during carbon isotropic analyses of extraterrestrial samples. P.K.Swart, M.M.Grady, C.T.Pillinger (Dept. of Earth Sci., Univ. of Cambridge, Cambridge, England).
Meteoritics (USA), vol.18, no.2, p.137-54 (30 June 1983).
The study of carbon abundance and isotropic composition in extraterrestrial samples is fraught with problems related to contamination in the terrestrial environment and during sample handling. A stepped combustion method is described which demonstrates that progress can be made towards resolving the indigenous species from contamination which for the most part burns at low temperature ($<425 \pm 25°$). The proposed method is not applicable to samples which have indigenous phases burning at low temperatures. A number of examples where its application is possible are given. (34 refs.)

121548 VRI photometry: an addendum. M.S.Bessell (Mount Stromlo & Siding Spring Obs., Australian Nat. Univ., Woden, Australia).
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.480-8 (Aug. 1983).
Single valued transformations are not possible between Johnson *VRI* colors measured using an S1 tube and the original Johnson filters and related *VRI* colors measured using S20 and GaAs tubes. Several effects contribute to this nonequivalence: the Balmer lines, Paschen discontinuity and reddening in hot stars, and metal line and molecule band absorption differences due to luminosity and abundance differences in late-type stars. This shows the importance in broad-band photometry (as in narrow-band photometry) of closely matching the passbands of photometric systems whose standards are to be used. Several Johnson-system *VRI* photometry sets are intercompared and linear transformations derived to the Cousins system. (9 refs.)

95.85 CATALOGUES, ATLASES ETC

121549 **Survey of the Astrographic Catalogue from 1 to 31 degrees of northern declination.** A.Fresneau (Space Telescope Sci. Inst., Baltimore, MD, USA).
Astron. J. (USA), vol.88, no.9, p.1378-81 (Sept. 1983).
5500 astrographic plates, covering nearly a quarter of the sky and providing 1870976 star positions (with a precision corresponding to a standard error of 0.4 arcsec) and photographic magnitudes (with a precision corresponding to a standard error of 0.4 mag) in the AGK 2/3 system, have been combined into a catalogue of 1025208 stars with their mean values of positions and magnitude at the mean epoch of observations (around 1905). This survey is essentially complete up to photographic magnitude 12.7. The integrated star densities in both galactic hemispheres are in good agreement. This survey, with at least 50 stars per square degree in most cases, may still be useful for photographic plate scale calibration. (11 refs.)

121550 **A catalogue of Jovian decametric radio observations from January 1980 to December 1981.** Y.Leblanc, A.Gerbault, M.Rubio, F.Genova (Obs. de Paris, Meudon, France).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.135-48 (Oct. 1983).
The catalogue lists Jupiter's decametric emission recorded by the Nancay Radiospectrograph during the period from January 1980 to December 1981. The events have been recorded in the spectral range of 10-40 MHz, eight hours daily. Diagrams showing the occurrence probability of emission during this period are given. In addition to the well-known high probability of the Io related B and A sources, the Io-A′ source identified by Leblanc (1981) is well defined with a higher occurrence probability than the non Io-controlled sources. (14 refs.)

121551 Catalogue of nonstellar molecular maser sources and their probable infrared counterparts in the galactic plane. M.A.Braz (Inst. Astron. e Geofisico, Univ. de Sao Paulo, Sao Paulo, Brazil), N.Epchtein.
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.167-85 (Oct. 1983).
The catalogue contains the positions and characteristics of 288 nonstellar maser sources located in the galactic disk and of 76 infrared objects assumed to be associated with a maser source in view of their proximity and protostellar characteristics. Some new statistical conclusions are drawn. The paper also provides a major reference list and is intended to prepare further statistical works on the distribution of star formation regions in the Galaxy and to help in the identification of IRAS sources. (262 refs.)

121552 Radial velocities of planetary nebulae. S.E.Schneider, Y.Terzian (Nat. Astron. & Ionosphere Center, Cornell Univ., Ithaca, NY, USA), A.Purgathofer, M.Perinotto.
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.399-423 (Aug. 1983).
A catalog of all known radial velocities and their errors for 524 galactic planetary nebulae is presented. One hundred and two sources have been consulted, comprising 920 separate velocity measurements are discussed. The various sources of error in the measurements and techniques for their estimation are explained. New radial velocity measurements for 19 planetary nebulae are included. Some basic statistics of the radial velocities of the planetary nebulae population are also presented. (109 refs.)

121553 Spectral evolution of galaxies. II. An atlas of IUE spectra of late type stars and nearby early type stellar systems. G.Bruzual A. (Centro de Investigacion de Astron., Merida, Venezuela).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.29-37 (June 1983).
For pt.I see Astrophys. J., vol.273, no.1, p.105-27 (1983). (15 refs.)

95.90 OTHER TOPICS IN ASTRONOMY AND ASTROPHYSICS

121554 Siblings for SETI. D.Frisch, F.Melia (MIT, Cambridge, MA, USA).
Icarus (USA), vol.55, no.3, pt.1, p.432-8 (Sept. 1983).
Intelligent beings can single out each other as special targets for communication if their stars have common properties, and can thus perhaps be stimulated to broadcast and listen directionally to try to give the coincidence between sending and listening that is necessary. The SAO Catalogue of roughly 260000 stars was culled for such 'sibling' candidates using their spectra, location, and motion. Only a few of the roughly 50000 tabulated G-stars proved interesting, in part because the information about almost all of them is imprecise, and in part perhaps because criteria were overselective. However, a set of mostly untabulated sibling candidate stars can be defined, given a direction and small solid angle that are mutually interesting to members of that set, so that overlapping broadcast/receiving cones can be selected on the basis of this commonality. The double cone about the direction to the galactic center, with half angle $\alpha=e^2/\hbar c=1/137$ radian, is an almost inevitable choice. With current technology, sending as well as receiving within this small solid angle can reach to about 1 kpsc, making available an estimated 10^3 G-star sibling candidates. (9 refs.)

121555 Simulation of Viking biology experiments suggests smectites not palagonites, as Martian soil analogues. A.Banin (Ames Res. Center, NASA, Moffett Field, CA, USA), L.Margulies.
Nature (GB), vol.305, no.5934, p.523-5 (6 Oct. 1983).
The mineralogical composition of the fine soil of Mars has not been determined and remains a controversial subject. During and immediately after the Viking mission, smectite clays were considered as the most likely Mars soil analogue material (MarSAM), but recently it has been suggested that the most likely MarSAM is palagonite, an amorphous weathering product of mafic volcanic glass. The authors present the results of an experimental comparison between palagonites and a smectite (montmorillonite) in a simulation of the Viking Biology Labelled Release (LR) experiment and draw conclusions regarding their suitability as MarSAMs. It was found that palagonites do not cause the formate decomposition and ^{14}C release observed in the LR experiment on Mars, neither in their natural form nor after acidification, and thus cannot be a completely satisfactory analogue to the mars soil studied by Viking. 96.00 SOLAR SYSTEM

96.10 GENERAL, SOLAR NEBULA, AND COSMOGONY

121556 Collisional processes of planetesimals with a protoplanet under the gravity of the proto-Sun. S.Nishida (Dept. of Industrial & Systems Engng., Setsunan Univ., Osaka, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.93-105 (July 1983).
The author investigates collisional processes of planetesimals with a protoplanet, assuming that the mass of the protoplanet is much larger than that of a planetesimal and the motion of the planetesimal is limited in the two-dimensional ecliptic plane. They describe the orbit by a solution to the plane circular restricted three-body problem. Integrating numerically the equations of motion of the plane circular RTB problem for numerous sets of initial osculating orbital elements, they obtain the overall features of the encounters between the Keplerian particles. They represent only the cases $e=0$ and $4h$, where e is the eccentricity of the planetesimal far from the protoplanet and h is the normalized Hill radius of the protoplanet. They find that the collisional rate of Keplerian particles is enhanced by a factor of about 2.3 ($e=0$) or 1.4 ($e=4h$) compared with that of particles in a free space, as long as they are concerned with the two-dimensional motion of particles. 121557 Possible lunar source areas of meteorite ALHA 81005: geochemical remote sensing information. C.M.Pieters (Dept. of Geological Sci., Brown Univ., Providence, RI, USA), B.R.Hawke, M.Gaffey, L.A.McFadden.
Geophys. Res. Lett. (USA), vol.10, no.9, p.813-16 (Sept. 1983).
Antarctic meteorite ALHA 81005 is a regolith breccia apparently sent to Earth by an impact event in the lunar highlands. Laboratory studies of this sample provide information that is used to understand the source region of the Moon using remote sensing data. The meteorites low thorium content is inconsistent with thorium values measured for the central lunar nearside from orbit with Apollo γ-ray spectrometers. Similarly, the mineral assemblages inferred from near infrared spectra of small impact craters on the lunar nearside do not exhibit the significant component of olivine and Fe-bearing feldspar that is observed in the meteorite spectra. The existing remote sensing data suggest the most probable source region for ALHA 81005 is the near-side limb or the lunar farside and that the composition of ALHA 81005 represents a surface unit that has not previously been extensively sampled. 121558 Intensity and polarization line profiles in a semi-infinite Rayleigh-scattering planetary atmosphere. II. Variations of equivalent width over the disk. R.K.Bhatia, K.D.Abhyankar (Centre of Advanced Study in Astron., Osmania Univ., Hyderabad, India).
J. Astrophys. & Astron. (India), vol.4, no.1, p.27-33 (March 1983). [received: Oct. 1983]
For pt.I see ibid., vol.3, no.3, p.303-24 (1982). The study of the variation of equivalent width in a Rayleigh-scattering planetary atmosphere along the intensity equator and along the mirror meridian on which $\mu=\mu_0$ shows that the equivalent widths decrease monotonically towards the poles, the limb and the terminator with the following characteristics: (i) the weakest lines exhibit the maximum change; (ii) the I_r^e component shows more change than the I_l^e component; (iii) the decrease towards the limb or the terminator is not as sharp as that towards the poles; (iv) I_l^e component shows more decrease towards the limb while I_r^e component shows more decrease towards the terminator; and (v) the relation $W(\mu,\phi;\mu_0,\phi_0)=W(\mu_0,\phi_0;\mu,\phi)$ holds for the total intensity. These results are qualitatively in agreement with the observations of absorption bands in the spectra of Venus, Jupiter and Saturn. (8 refs.)

121559 Intensity and polarization line profiles in a semi-infinite Rayleigh-scattering planetary atmosphere. III. Variation of polarization profiles and the Stokes parameter Q over the disk. R.K.Bhatia, K.D.Abhyankar (Centre of Advanced Study in Astron., Osmania Univ., Hyderabad, India).
J. Astrophys. & Astron. (India), vol.4, no.1, p.35-46 (March 1983). [received: Oct. 1983]
For pt.II see ibid., vol.4, no.1, p.27-33 (1983). The variation of the polarization profiles, the Stokes parameters Q and U, and the angle defining the plane of polarization along the intensity equator and along the mirror meridian, on which $\mu=\mu_0$, in a Rayleigh-scattering atmosphere is studied. It is found that these variations are more complex than thought hitherto, particularly at large phase angles. (7 refs.)

121560 Impact experiments on ice. S.Kawakami, H.Mizutani, Y.Tagai, M.Kato, M.Kumazawa (Dept. of Earth Sci., Nagoya Univ., Nagoya, Japan).
J. Geophys. Res. (USA), vol.88, no.B7, p.5806-14 (10 July 1983).
The results of cratering and fragmentation experiments on pure ice are reported. The projectiles used are cylindrical aluminum, poly-carbonate, Teflon, and pyrophyllite fired at velocities between 110 m/sec and 680 m/sec, with kinetic energies at impact between 2 and 500 joules. Crater depths and diameters were studied and comparisons with craters in basalt were made. The specific energy for complete destruction of ice target is about 50 J/Kg. The present experiments show that the impacts associated with the largest craters on Callisto and Mimas must have severally fractured the whole satel-

lites, and that those giant impacts with the kinetic energy of 10^{23} to 10^{27} joules probably affected significantly the evolution of the satellites. (33 refs.)

96.30E Venus

121561 Photographic positional observations of Venus at the main astronomical observatory of the Ukrainian Academy of Sciences during 1975. A.B.Onegina, E.M.Sereda.
Astrometriya & Astrofiz. (USSR), no.49, p.13-17 (1983). In Russian.
35 positions of Venus are given in the reference stellar system of the Catalogue of the Smithsonian Astrophysical Observatory and that of AGK3. The plates were obtained with the 400 mm astrograph (F=5.5 m) during 1975. The positions of Venus are given with corrections for atmospheric dispersion and for the phase of the planet. (2 refs.)

121562 Evaluating aerosol concentration in the upper cloud layer of Venus. N.V.Goroshkova, E.V.Petrova.
Cosmic Res. (USA), vol.21, no.1, p.91-5 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.106-10 (Jan.-Feb. 1983). [received: Sept. 1983]
An improved calculation is given for the spectral variation of the extinction coefficient for an aerosol medium of a 75% solution of H_2SO_4 in the range from 200-1400 cm^{-1}. Sulfuric acid bands have been obtained which have been identified in the Venus spectrum. The concentration of particles in the upper layer of clouds has been found, and the results are compared with radiometric experiment data on the Venera 9 and 10 spacecraft, and the experiment carried out with Pioneer-Venus experiment. (14 refs.)

121563 Nonthermal escape of hydrogen and deuterium from Venus and implications for loss of water. S.Kumar (Center for Space Sci., Univ. of Southern California, Los Angeles, CA, USA), D.M.Hunten, J.B.Pollack.
Icarus (USA), vol.55, no.3, pt.1, p.369-89 (Sept. 1983).
Nonthermal escape processes responsible for the escape of hydrogen and deuterium from Venus are examined for present and past atmospheres. Three mechanisms are important for the escape of hydrogen from the present atmosphere: (a) charge exchange of plasmaspheric H^+ with exospheric H, (b) impact of exospheric hot O atoms on H, and (c) ion molecule reactions involving O^+ and H_2. However, in the past when the H abundance was higher, the charge-exchange mechanism would be the strongest. The H and D escape fluxes are discussed with the H_2O mixing ratio. The onset of hydrodynamic flow leading to efficient H escape occurs just at the H_2O mixing ratio at which the charge-exchange escape flux saturates. Thus it is possible that Venus has lost an Earth-equivalent ocean of water over geologic time. (60 refs.)

121564 Venus: identification of banded terrain in the mountains of Ishtar Terra. D.B.Campbell (Nat. Astron. & Ionospheric Center, Arecibo Obs., Arecibo, Puerto Rico), J.W.Head, J.K.Harmon, A.A.Hine.
Science (USA), vol.221, no.4611, p.644-7 (12 Aug. 1983).
High resolution images obtained with the Arecibo radar system at a wavelength of 12.6 centimeters reveal numerous parallel 10 to 20-kilometer-wide bands of high radar backscatter situated on and oriented parallel to the major mountain ranges of the Ishtar Terra region of Venus. Geometric and morphological characteristics suggest that the bands represent Earth-like tectonic deformational features, such as folds and faults. (22 refs.)

96.30G Mars

121565 Nature of the magnetic fields near Mars. E.M.Dubinin, P.L.Izrailevich, I.M.Podgornyi, S.I.Shkol'nikova.
Cosmic Res. (USA), vol.21, no.1, p.95-9 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.111-15 (Jan.-Feb. 1983). [received: Sept. 1983]
An analysis of magnetic field measurements from the spacecraft Mars 3 and Mars 5, which were made in a rotating coordinate system with axis defined by the direction of the interplanetary magnetic field, has shown that there is a region near Mars in which there is no correlation between the direction of the measured magnetic field and that of the transverse component of the interplanetary magnetic field. The field in this region is the intrinsic field of Mars. The distribution of the magnetic field vectors between this region and the shock wave is in agreement. with a blanketing model. (18 refs.)

121566 Observations of the 10-μm natural laser emission from the mesospheres of Mars and Venus. D.Deming, F.Espenak, D.Jennings, T.Kostiuk, M.J.Mumma (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), D.Zipoy.
Icarus (USA), vol.55, no.3, pt.1, p.347-55 (Sept. 1983).
Nonthermal emission occurs in the cores of the 9.4- and 10.4-μm CO_2 bands on Mars, and has been identified as a natural atmospheric laser. This paper presents observations of the total flux and center-to-limb dependence of this emission for Mars and Venus. The emission is believed to be excited by absorption of solar flux in the near-IR CO_2 bands, followed by collisional transfer to the 00°1 state of CO_2. A comparison is made between the observations and a detailed theoretical model based on this mechanism. The emission is used to obtain the kinetic temperatures of the Martian and Venusian mesospheres. (21 refs.)

121567 Modeling of the 10-μm natural laser emission from the mesospheres of Mars and Venus. D.Deming, M.J.Mumma (NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Icarus (USA), vol.55, no.3, pt.1, p.356-68 (Sept. 1983).
Nonthermal emission which occurs in the cores of the 9.4- and 10.4-μm CO_2 bands on Mars has been identified as a natural atmospheric laser. The emission is believed to be excited by absorption of near-IR solar flux, followed by collisional transfer to the 00°1 state of CO_2. A numerical model based on this mechanism is developed which includes the solar pumping contributed by $\sim 2\times 10^4$ near-IR CO_2 lines. The non-Local Thermodynamic Equilibrium radiative transfer problem is solved to obtain the 00°1 vibrational state population. This model successfully reproduces the existing center-to-limb observations, although higher spatial resolution observations are needed for a definitive test. (25 refs.)

121568 Speculation on Martian north polar wind circulation and the resultant orientations of polar sand dunes. A.W.Ward, K.B.Doyle (US Geological Survey, Flagstaff, AZ, USA).
Icarus (USA), vol.55, no.3, pt.1, p.420-31 (Sept. 1983).
Dunes in the Martian north polar erg show two dominant orientations. When seen at frost cap minimum, dunes north of 80°N record east winds, dunes south of 80°N record west winds. Many of the transverse dunes are considered to be reversing dunes. Dunes in two fields may have reversed at least once during the lifetime of the Viking Orbiters. Poor agreement exists among published predictive models of north polar winds and the interpretations derived from the major published map of the north polar dunes. The authors propose that the average polar winds are: (1) strong, off-pole northwest winds in fall; (2) moderate west winds in winter; (3) latitude-dependent weak to strong off-pole northeast winds in spring; and (4) weak west winds in summer. (19 refs.)

121569 Laboratory exercises in astronomy—the orbit of Mars. O.Gingerich (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Sky & Telesc. (USA), vol.66, no.4, p.300-2 (Oct. 1983).
Discusses a procedure to determine the orbit and apparent motion of Mars. The scheme was originally presented by Kepler and a brief historical note is presented. (no refs.)

96.30H Asteroids

121570 The Tunguska event: no cometary signature in evidence. Z.Sekanina (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Astron. J. (USA), vol.88, no.9, p.1382-14 (Sept. 1983).
It is argued that existing information on the 1908 Tunguska fall rules out the possibility that the object was a comet fragment, active or extinct. Evidence on the fireball's enormous terminal explosion several kilometers above the Earth is indicative of the apparent absence of a major breakup in flight before the almost instantaneous mass dissipation of $\sim 10^{12}$g and invites comparison with a number of the Prairie Network and European Network fireballs displaying prominent terminal flares. It is shown that a fireball of the Tunguska mass is not decelerated very efficiently by the Earth's atmosphere regardless of the assumed ablation rate. As a result, at an entry velocity of $\sim$30 km/s the fireball would have resisted aerodynamic pressures in excess of 10^9 dyn/cm^2 before disintegrating. It is inconceivable that cometary material known for its extreme fragility could survive a load of this magnitude. The data on the Type II fireballs with prominent terminal flares are extrapolated to estimate Tunguska's critical dynamic pressure at the explosion to be some 2×10^8 dyn/cm^2 and to infer that the fireball's pre-explosion velocity amounted to $\sim$10 km/s, ruling out a comet-like orbit. In order for the Tunguska object to penetrate deep into the atmosphere, high ablation rates that are characteristic of cometary fireballs should require that Tunguska's initial mass be orders of magnitude greater than indicated by evidence. Its association with a short-period comet of Jupiter's family, including P/Encke, is furthermore contradicted by much too large an angle that Tunguska's line of apsides would then make with Jupiter's orbit plane. The Tunguska object is described most consistently as a small Apollo-type asteroid, 90-190 m across, having orbited the Sun between $\lesssim 1$ and 1.5 Au before it struck the Earth. The object's common origin with the Farmington meteorite is considered but found to be highly unlikely. (86 refs.)

121571 308 astrometric positions of minor planets—in February and March 1981, ESO, La Silla, Chile. H.Debehogne (Obs. Royal de Belgique, Brussels, Belgium), L.E.Machado, J.F.Caldeira, E.R.Netto, G.G.Vieira.
Acta Astron. (Poland), vol.33, no.1, p.171-81 (1983).
308 astronomical positions and dependences of asteroids are given as obtained from photographic observations made at the GPO (D=40 cm; f=4 m)-ESO, La Silla, Chile, during February and March 1981. The reductions of the observations were obtained by means of five reference stars (RAO Catalogue) through two methods: dependences and least squares. (no refs.)

121572 381 astrometric positions of minor planets obtained at the GPO telescope of ESO, La Silla, February/March, 1981. H.Debehogne (Obs. Royal de Belgique, Brussels, Belgium), L.E.Machado, J.F.Caldeira, G.G.Vieira, E.R.Netto, A.Le Van Suu.
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.47-53 (Oct. 1983).
381 astrometric positions of minor planets observed at the European Southern Observatory during February/March, 1981 are given. The plates were measured on the Ascorecord measuring machine of the Observatorio do Valongo. The positions were computed by means of dependences and of least squares. The SAO Star Catalogue was used for positions and proper motions of the comparison (basis) stars at the equinox 1950.0. (4 refs.)

121573 Positions of asteroids obtained with the CERGA Schmidt telescope. G.Hahn (Astron. Obs., Uppsala, Sweden), J.-L.Heudier, C.-I.Lagerkvist.
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.191-2 (Oct. 1983).
50 positions of numbered asteroids and 82 positions of unnumbered asteroids obtained during January and February 1982 with the CERGA Schmidt telescope are presented. (2 refs.)

121574 Asteroids and meteorites: parent bodies and delivered samples. R.Greenberg, C.R.Chapman (Planetary Sci. Inst., Tucson, AZ, USA).
Icarus (USA), vol.55, no.3, pt.1, p.455-81 (Sept. 1983).
Meteorites may be derived mainly by cratering rather than by disruptive fragmentation and from large main-belt asteroids rather than from small, Earth-approaching bodies. The model combines a wide variety of evidence from various disciplines to yield results consistent with meteorite statistics. However, no claim is made for uniqueness of this model, and many elements still admit considerable uncertainty. (43 refs.)

121575 A mechanism of formation for the Kirkwood gaps. J.Henrard, A.Lemaitre (Dept. of Maths., Facultes Univ. de Namur, Namur, Belgium).
Icarus (USA), vol.55, no.3, pt.1, p.482-94 (Sept. 1983).
An analytical model describing the effect of a displacement of the Jovian resonances in the asteroid belt is analyzed. It is found that a small displacement can transform a truncated uniform density distribution of asteroids into a gap. As a possible explanation for the displacement, the effect of the removal of an accretion disk in the early stage of the solar system is investigated. It is found that removal of a disk containing a few percent of the solar

mass between the orbit of the asteroids and the orbit of Jupiter is sufficient to account for the observed Hecuba gap. (22 refs.)

121576 The rotation, color, phase coefficient, and diameter of 1915 Quetzalcoatl. R.P.Binzel (Dept. of Astron., Univ. of Texas, Austin, TX, USA), D.J.Tholen.
Icarus (USA), vol.55, no.3, pt.1, p.495-7 (Sept. 1983).
Photoelectric observations of 1915 Quetzalcoatl on March 2, 1981 show that this asteroid has a rotational period of 4.9 ± 0.3 hr and a lightcurve amplitude of 0.26 magnitudes. B-V and U-B colors are found to be 0.83 ± 0.04 and 0.43 ± 0.03, respectively, consistent with Quetzalcoatl being an *S*-type asteroid. Additional observations from March 31, 1981 give a linear phase coefficient of 0.033 mag deg^{-1} and a mean $B(1,0)$ magnitude of 20.10. The resulting estimated mean diameter for Quetzalcoatl is only 0.37 km, making it one of the smallest asteroids for which physical observations have yet been made. (9 refs.)

121577 1983 SA. P.Wild.
I.A.U. Circ. (USA), no.3871, 1 pp. (30 Sept. 1983).
Reports the discovery of a fast-moving asteroidal object in Pegasus. Two precise positions are reported for the period 1983 September 26 to 28. (no refs.)

121578 1983 RD. A.W.Harris.
I.A.U. Circ. (USA), no.3871, 1 pp. (30 Sept. 1983).
It is reported that the rotation period of this Amor-type asteroid was still ambiguous (i.e. 4.90 or 2.45 hours) after photometric observations on 1983 September 15. The peak-to-peak amplitude at this time was found to be >0.10 mag. (1 ref.)

121579 1983 SA. P.Wild, B.G.Marsden.
I.A.U. Circ. (USA), no.3875, 1 pp. (5 Oct. 1983).
Three precise positions, covering the period 1983 October 1 to 3, are reported for this fast-moving asteroidal object. Orbital elements are given, together with an ephemeris for the period 1983 September 3 to November 2 at five-day intervals; the orbit is found to be cometary rather than asteroidal. (no refs.)

121580 1983 SA. E.Bowell, B.G.Marsden.
I.A.U. Circ. (USA), no.3877, 1 pp. (7 Oct. 1983).
Precise positions of this fast-moving asteroidal object are reported for the epochs 1983 September 10 and October 4, together with improved orbital elements. (no refs.)

121581 Minor Planet Circulars 8085-8/82.
Minor Planet Circ. (USA), no.8085-8182, 98 pp. (22 Sept. 1983).
Present precise positions for asteroids and 23 comets observed at 22 observatories or observing stations. Indentification changes are given for three asteroids and eight objects are identified with numbered minor planets. Orbital elements are given for seven comets, 127 one-opposition asteroids, newly-numbered asteroids 2910-2927, and one named object (993 MOULTONA) as well as 25 asteroids still with just discovery designations including two Palomar-Leiden objects. Ephemerides are given for seven comets and 78 minor planets for the inclusive period 1983 September 23-1985 April 5 at 10-day intervals. Finally new names are given to 26 sasteroids.

121582 363 precise positions of asteroids. H.Debehogne (Obs. Royal de Belgique, Brussels, Belgium), L.E.Machado, J.F.Caldeira, E.R.Netto, G.G.Vieira.
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.19-27 (June 1983).
363 astronomical positions and dependences of asteroids are given as obtained from photographic observations made at the GPO (D=40 cm; f=4 m)-ESO, La Silla, Chile, during February and March 1981. The reductions of the observations are obtained by means of five reference stars (SAO Catalogue) through two methods: dependences and least squares. Of the 363 positions, 206 correspond to 5 new asteroids. (3 refs.)

121583 A finite-volume, adaptive grid algorithm applied to planetary entry flowfields. P.A.Gnoffo (NASA Langley Res. Center, Hampton, VA, USA).
AIAA J. (USA), vol.21, no.9, p.1249-54 (Sept. 1983).
An adaptive grid, finite volume method has been applied to problems of planetary entry in computing complete flowfields. The adaptation algorithm is implicit in nature and is keyed to resolve user-specified gradients. The finite-volume algorithm is explicit, utilizing a maximum time step advancement at each grid point to accelerate convergence to the steady state. The present version of the code is for the laminar flow of a perfect gas. The role of the adaptation algorithm in resolving various features of blunt body/wake flow for planetary entry conditions is emphasized. The algorithm is demonstrated on problems involving massive blowing from the surface of the Galileo probe and moderate blowing from the surface of a sphere. (16 refs.)

121584 A new type of decameter sporadic radiation from Jupiter. B.P.Ryabov, V.A.Shevchenko.
Astrometriya & Astrofiz. (USSR), no.49, p.27-31 (1983). In Russian.
Presents results of observations of Jupiter obtained in the 10-17.5 MHz range. Measurements were made with a 30-channel parallel spectrum analyzer providing frequency resolution of 250 kHz and time resolution of 3 ms. A new type of decameter radiation—a succession of single wide-band pulses of 10-100 ms in duration—was found along with the well-known type L and type S radio bursts. The pulses show no frequency drift and resemble the VLF signals from lightning discharges which were recorded during the Voyager-1 mission. (7 refs.)

121585 Inertia coefficient considerations and the structure of Jovian planets. C.Denis (Dept. of Phys., Middle East Tech. Univ., Ankara, Turkey).
Celestial Mech. (Netherlands), vol.31, no.1, p.81-94 (Sept. 1983).
For Jupiter, an overall density model of the form $\rho=\rho_0(1-x^n)$, with $n \approx {}^1/_3$ and $\rho_0/\bar{\rho} \approx 10$, is consistent with information presently at hand; for Saturn, however, such a density law would lead to unacceptably high densities in the vicinity of the centre. The limiting cases of the previous law are shown to be $n=+\infty$, corresponding to a homogeneous sphere, and $n=-3$, corresponding to a particular central particle model, investigated by a number of astronomers over the last hundred years. For $n \leq 0$, the central density becomes $+\infty$. Another possible representation, valid both for Jupiter and Saturn, is the density law $\rho=\rho_0(1-x)^m$, with $m \approx {}^7/_6$, $\rho_0/\bar{\rho} \approx 4.7$ in the case of Jupiter, and $m \approx {}^5/_3$, $\rho_0/\bar{\rho} \approx 7.5$ in the case of Saturn. Graber's (1977) density law based on a maximum entropy principle leads to unacceptably high surface densities, both for Jupiter and Saturn. The author investigates the problems involved in fitting two-layered parametrically simple density laws to theoretically derived much more elaborate models of the Jovian planets. (13 refs.)

121586 The Jovian spectrum in the 3-μm window. P.Drossart, T.Encrenaz (Obs. de Meudon, Meudon, France).
Icarus (USA), vol.55, no.3, pt.1, p.390-8 (Sept. 1983).
The spectral window of Jupiter at 3 μm is analyzed and compared with previous published spectra. The two components of the spectrum, the thermal and the solar reflected contributions, are calculated at low resolution (30 cm^{-1}) between 3300 and 3800 cm^{-1} for preparing the interpretation of the Galileo Near Infrared Mapping Spectrometer experiment. (29 refs.)

121587 Formation and photochemistry of methylamine in Jupiter's atmosphere. J.A.Kaye, D.F.Strobel (Naval Res. Lab., Washington, DC, USA).
Icarus (USA), vol.55, no.3, pt.1, p.399-419 (Sept. 1983).
The formation of methylamine (CH_3NH_2) in the upper troposphere and lower stratosphere of Jupiter is investigated. Translationally hot hydrogen atoms are produced in the photolysis of ammonia, phosphine, and acetylene which react with methane to produce methyl (CH_3) radicals; the latter recombine with NH_2 to form CH_3NH_2. Also, methane is catalytically dissociated to CH_3+H by the species C_2 and C_2H produced in the photolysis of acetylene. It is shown that the combined production of CH_3NH_2 and subsequent photolysis to HCN is unlikely to account for the HCN observed near Jupiter's tropopause. Recombination of NH_2 and C_2H_3 radicals to yield C_2H_5N followed by photolysis to HCN is the preferred path. Production of C_2H_6 by these two processes is negligible in comparison to the downward flux of C_2H_6 from the Lyman α photolysis region of CH_4. An upper limit column density on CH_3PH_2 is estimated to be $\sim 10^{13}$ cm^{-2} as compared to 10^{15} cm^{-2} for CH_3NH_2. Hot H atoms account for a negligible fraction of total ortho-para conversion by the reaction $H+H_2$. (65 refs.)

121588 Satellites of Jupiter and Saturn. R.M.West.
I.A.U. Circ. (USA), no.3872, 1 pp. (30 Sept. 1983).
Names and permanent designations are given for recently discovered satellites of Jupiter and Saturn. (1 ref.)

121589 Charged particle distributions in Jupiter's magnetosphere. N.Divine, H.B.Garrett (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6889-903 (1 Sept. 1983).
A compact, quantitative model of the distribution of charged particles between 1 eV and several MeV in the Jovian magnetosphere is presented. The model is based primarily on in situ data returned by experiments on the Pioneer and Voyager spacecraft, supplemented where necessary by Earth-based observations and theoretical considerations. Thermal plasma parameters, notably convection speed, number density, and characteristic energy, are specified as functions of position for electrons and several ion species (H^+, O^+, O^{++}, S^+ S^{++}, S^{+++}, and Na^+). At intermediate energy the electron and proton populations are modeled using kappa distributions, which join smoothly onto the radiation belt spectra at high energies ($E>100$ keV). Major features of the magnetic field, thermal plasma, and trapped particle distributions are modeled, such as a ring and satellite absorption signatures and corotational flow within the Io plasma torus and the current disk. (69 refs.)

121590 Global multispectral mosaics of the icy Galilean satellites. T.V.Johnson (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), L.A.Soderblom, J.A.Mosher, G.E.Danielson, A.F.Cook, P.Kupferman.
J. Geophys. Res. (USA), vol.88, no.B7, p.5789-805 (10 July 1983).
Multispectral mosaics of the three icy Galilean satellites have been produced from low- to moderate-resolution Voyager images. The digital image data have been reduced to normal albedos for four-color band passes, centered at 0.35, 0.41, 0.48 and 0.59 μm. Cylindrical map projection at a uniform scale of 8 km per pixel was used. Preliminary analysis of the normal abedo data shows that (1) the darkest terrains on the satellites are the dark regions on Callisto, (2) the brightest regions are bright plains regions on Europa and bright, fresh craters on Ganymede, (3) bright craters on Ganymede and its dark, cratered regions are both significantly brighter than comparable terrains on Callisto, and (4) Europa exhibits several distinct spectral units. (46 refs.)

96.30M Saturn

121591 Some consequences of meteoroid impacts on Saturn's rings. G.E.Morfill (Max-Planck-Inst. fur Extraterrestrische Phys., Garching, Germany), H.Fechtig, E.Grun, C.K.Goertz.
Icarus (USA), vol.55, no.3, pt.1, p.439-47 (Sept. 1983).
High-velocity impacts of interplanetary meteoroids on Saturn's rings are discussed. It is shown that the neutral gas emitted by impact vaporization may be responsible, to a large part, for the observed neutral ring atmosphere. Both the predicted neutral gas injection rate and the gas temperature (or kinetic energy) are compatible with measurements. Heavy ejecta particles produce a particulate ring 'halo'. The physical properties of this halo are calculated, and it appears to be identical with the tenuous particle population discussed by Baum and Kreidl (1982). Erosion of Saturn's ring particles, the resulting mass balance, and regolith formation are estimated. This provides some constraints on surface properties and optical albedo. (34 refs.)

121592 Radio emission signature of Saturn immersions in Jupiter's magnetic tail. M.D.Desch (Lab. for Extraterrestrial Phys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6904-10 (1 Sept. 1983).
During the interval from about May through August 1981, when Voyager 2 was inbound to Saturn, the planetary radio astronomy instrument measured repeated, dramatic decreases in the intensity of the Saturn kilometric radiation (SKR). The emission dropouts averaged two orders of magnitude below mean energy levels and varied from about 1 to 10 Saturn rotations in duration. Comparison with pre-Saturn encounter Voyager 1 observations shows that the SKR dropouts were unique to the Voyager 2 observing interval, consistent with the closer proximity of Saturn to Jupiter's distant magnetotail in 1981. Further, the dropouts occurred on the average at times when Voyager 2 is known to have been within or near Jupiter's magnetic tail. Interpretation of these events as the radio signatures of successive Saturn immersions into Jupiter's tail or wake region is consistent with the independent evidence that the SKR radio source is driven externally by the solar wind ram pressure. (15 refs.)

121593 Absorption of energetic protons by Saturn's Ring G. J.A.van Allen (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.6911-18 (1 Sept. 1983).
A restudy has been made of Pioneer 11 data on the distribution of energetic protons $E_p>80$ MeV in Saturn's inner magnetosphere. An improved value of the ratio of the cosmic ray albedo neutron decay source strength \$ to the radial diffusion coefficient D is 6.9×10^{-24} cm^{-5} at $r\simeq2.67$ R_s (1 R_s=Saturn's equatorial radius). Using the recently calculated lower limit of \$ by Blake et al., one finds an upper limit on the mean residence time T against diffusion of 4.6×10^8 s (15 years) in the major peak of the distribution, whereas using the author's ealier estimate of \$, one finds $T\sim2.2\times10^8$ s (8.0 years). A generous upper limit on D is 2×10^{-10} R_s^2 s^{-1} as found from study of the slot region associated with the co-orbiting satellites 1979 S2 (1980 S3) and 1980 S1. The mean lifetime τ of energetic protons against absorption by particulate matter in Ring G is $<1.1\times10^8$ s (3.5 years) and $\sim5.1\times10^7$ s (1.6 years) corresponding to the two choices of \$. The particulates in Ring G have an effective radius $R\geq0.035$ cm, an areal mass density $\sigma>1.4\times10^{-6}$ g cm^{-2}, and areal number density $n<8\times10^{-3}$ cm^{-2}. It is unlikely that R exceeds 0.1 cm. The radius of Ring G is calculated. (23 refs.)

121594 Optical properties of interplanetary dust: comparison with light scattering by larger meteoritic and terrestrial grains. K.Weiss-Wrana (Bereich Extraterrestrische Phys., Ruhr-Univ. Bochum, Bochum, Germany).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.240-50 (Oct. 1983).
Recent knowledge about interplanetary dust particles suggests that the main contribution of the zodiacal light is produced by particles between 10 to 100 μm in size. To investigate the scattering characteristics of single particles in this size range systematically, a light scattering instrument was built using electrostatic levitation of single particles. The measured particles consist of terrestrial as well as meteoritic material. Laboratory results demonstrate that the scattering properties of irregularly shaped dark opaque particles with very rough surface and of fluffy dark opaque particles resemble the characteristic features of the empirical scattering function as derived from measurements of the zodiacal light. 96.50G Comets

121595 Perturbation in the Comet's motion caused by Ceres, Pallas and Vesta. B.Todorovic-Juchniewicz (Space Res. Center, Acad. of Sci., Warsaw, Poland).
Acta Astron. (Poland), vol.33, no.1, p.113-17 (1983).
Contains the findings of the magnitude of the perturbations on comets due to the minor planets. The perturbations which are caused by the the three largest minor planets in the heliocentric rectangular coordinates, the mean anomaly, the right ascension and the declination are calculated for fifty periodic comets and three parabolic comets. The minimum distances of a comet from the minor planets after every perihelion and aphelion are obtained. The results clearly indicate that the magnitude of the disturbances is connected with the 'depth' of an approach of a comet to the minor planet, with the time of the mutual influence and with the number of these approaches. (2 refs.)

121596 Improved orbits of three periodic comets: Reinmuth 1, Slaughter-Burnham and Kearns-Kwee. B.Todorovic-Juchniewicz (Space Res. Center, Polish Acad. of Sci., Warsaw, Poland).
Acta Astron. (Poland), vol.33, no.1, p.119-26 (1983).
Observations during five apparitions of Comet Reinmuth 1, three apparitions of Comet Slaughter-Burnham and three of Comet Kearns-Kwee are collected and the orbits of the comets are improved. The following numbers of observations were used when improving the orbits: 59 of Comet Reinmuth 1, 29 of Comet Slaughter-Burnham and 184 of Comet Kearns-Kwee. Nongravitational effects are found in the motion of Comets Reinmuth 1 and Kearns-Kwee. (9 refs.)

121597 Determination of nongravitational parameters for some periodic comets. G.Forti (Osservatorio Astrofisico di Arcetri, Firenze, Italy).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.307-10 (Oct. 1983).
Nongravitational parameters have been redetermined for the periodic comets Schwassmann-Wachmann 2 and Comas Sola. The new results agree with earlier values. New nongravitational constants are computed for comets Ashbrook-Jackson and Kearns-Kwee. For both comets the orbit for the next return is computed taking into account the nongravitational forces. (4 refs.)

121598 On the first transit of nearly parabolic comets across the inner part of the Solar System. Yu.G.Bebenko.
Astrometriya & Astrofiz. (USSR), no.49, p.18-22 (1983). In Russian.
Discusses the first transit of nearly parabolic comets across the inner part of the Solar System as well as the comet number distribution depending on the reciprocals of the major semiaxes. The comet excess in the range of $(50\text{-}100)\times10^{-6}(\mathrm{AU})^{-1}$ is discussed. (13 refs.)

121599 The interaction of comets with solar radiation and the solar wind. I. D.A.Mendis, H.L.F.Houpis (Dept. of Electrical Engng. & Computer Sci., Univ. of California, San Diego, CA, USA).
Int. Comet Q. (USA), vol.5, no.3, p.51-9 (July 1983).
Spectrophotometry of comet atmospheres and tails is discussed. A list is given of spectral identifications in comets. Atmosphere abundances and production rates are discussed. Models are considered. (no refs.)

121600 Recent visual observations of nuclear outbursts in P/Kopff 1982k. J.E.Bortle.
Int. Comet Q. (USA), vol.5, no.3, p.59-60 (July 1983).
At the initiation of each outburst, a bright completely stellar nucleus appears. Within a few days, this feature, while remaining very dense in appearance, becomes non-stellar and progressively spreads across the coma. As it does so, the area of greatest condensation grows slowly weaker, dropping several units in degree of condensation. A minute stellar or near-stellar nucleus does seem to persist throughout each of the outbursts. The author discusses several observations during the period April 18 to July 11 1982. (no refs.)

121601 The light curve of Periodic Comet d'Arrest 1982e. J.E.Bortle.
Int. Comet Q. (USA), vol.5, no.3, p.61-3 (July 1983).
Photometry and visual appearances throughout 1982 are discussed. Magnitude formulae are also considered. (2 refs.)

121602 Tabulation of comet observations.
Int. Comet Q. (USA), vol.5, no.3, p.64-80 (July 1983).
Presents observations of Comet Kohler (1977 XIV), Comet Meier (1978 XXI), Comet Bradfield (1979 X), Comet Meier (1980 XII), Comet Panther (1981 II), comet Austin (1982g), Comet IRAS-Araki-Alcock (1983d), Comet Sugano-Saigusa-Fujikawa (1983e), Comet Cernis (1983l), Periodic Comet Pons-Winnecke (1983b), Periodic Comet Tempel 1 (1982j), Periodic Comet Tempel 2 (1982d), Periodic Comet d'Arrest (1982e), Periodic Comet Kopff (1982k), Periodic Comet Johnson (1983h), Periodic Comet Churyumov-Gerasimenko (1982f), Periodic Comet Gunn, Periodic Comet Russell 3 (1983i), and Periodic Comet Schwassman-Wachmann 1 and Periodic Comet Stephan-Oterma (1980 X). (no refs.)

121603 Modern view on Laplace's problem. H.Hurnik, R.A.Serafin (Astron. Obs., A. Mickiewicz Univ., Poznan, Poland).
Celestial Mech. (Netherlands), vol.31, no.1, p.53-72 (Sept. 1983).
Considers the Laplace's problem pertaining to occurrence probability of elliptical and hyperbolical orbits of comets, assuming various distributions of their velocities and variable initial conditions. Such approach seems to explain contradictory results obtained by different investigators and suggests that predominance of one type over the other type orbits, may result part from assumed maximal velocity range of comets and their velocity distribution. (25 refs.)

121604 Cometary impacts with the Sun: physical and dynamical considerations. P.R.Weissman (Earth & Space Sci. Div., Jet Propulsion Lab., Pasadena, CA, USA).
Icarus (USA), vol.55, no.3, pt.1, p.448-54 (Sept. 1983).
Michels et al. (1982) observed a comet which appears to have impacted the Sun. Sekanina (1982) showed that the comet, 1979 XI, was probably a member of the Kreutz group of Sun-grazing comets. The Sun-grazers typically have perihelia of 1.2-1.9 solar radii but Sekanina found $q=0.35$ $R_\odot$ for 1979 XI. It is interesting to speculate how the perihelion may have been reduced to this small value. The change in perihelion can not be explained by planetary, stellar, or nongravitational perturbations. Tidal splitting of the nucleus on a previous perihelion passage is also ruled out, though a random splitting event near aphelion of the comet's orbit is a remote possibility. The most plausible explanation is collision with another body, most likely a comet, at large heliocentric distance. Another aspect of the problem is whether the nucleus of 1979 XI sublimated completely before impacting the Sun. (23 refs.)

121605 Comet Kowal-Vavrova (1983t). B.G.Marsden, Z.Vavrova.
I.A.U. Circ. (USA), no.3871, 1 pp. (30 Sept. 1983).
It is reported that the new comet announced on IAUC 3868 appears to be identical with the object discovered by Z. Vavrova and listed on MPC 8008 under the designation 1983 JG. Two precise positions measured by Vavrova on 1983 May 14 are reported. (2 refs.)

121606 Comet IRAS (1983o). P.M.Kilmartin, B.G.Marsden.
I.A.U. Circ. (USA), no.3873, 1 pp. (4 Oct. 1983).
Two precise positions are reported for the epoch 1983 September 16, together with improved parabolic orbital elements. (no refs.)

121607 Periodic Comet Halley (1982i). M.J.S.Belton, P.A.Wehinger, S.Wyckoff.
I.A.U. Circ. (USA), no.3873, 1 pp. (4 Oct. 1983).
Two precise positions are reported for the epoch 1983 February 13, together with preliminary BV photometry for the same epoch. An R-magnitude is reported for the epoch 1982 October 20. (1 ref.)

121608 Comet Shoemaker (1983p). E.Everhart, A.C.Gilmore, B.Milet, B.Skiff, B.G.Marsden.
I.A.U. Circ. (USA), no.3874, 1 pp. (4 Oct. 1983).
Precise positions are reported for the period 1983 September 16 to 28. Improved parabolic orbital elements are presented, together with an ephemeris for the period 1983 November 2 to 1984 January 1 at ten-day intervals.

121609 Periodic Comet Crommelin (1983n). S.Koutchmy, P.Laques, J.Lecacheux.
I.A.U. Circ. (USA), no.3876, 1pp (5 Oct. 1983).
Reports three precise positions for the epoch 1983 September 4. (no refs.)

121610 Aphelion clustering of 'new' comets: star tracks through Oort's cloud. L.Biermann, W.F.Huebner, R.Lust (Max-Planck-Inst. fur Phys. & Astrophys., Inst. fur Astrophys., Garching, Germany).
Proc. Natl. Acad. Sci. USA, vol.80, no.16, p.5151-5 (Aug. 1983).
An explanation is proposed for the observed and often discussed clustering of long-period comet aphelia on the sky. Poisson and several multinomial distributions are applied to the most conspicuous cluster, considering only the 80 'new' and 59 'intermediate' comets with the best-determined orbits. The observed number of aphelion points in adjacent areas in two tests with 24 and 36 equal sky areas, respectively, shows a large deviation from a random distribution. The expected probability frequency for this to happen by chance is $<0.1\%$ for the'new' comets alone; it is further reduced when 'new' and 'intermediate' comets are combined. When these comets are analyzed separately from others, it is found that the clustering is the result of perturbations of their original orbits by the passage of a star, or a stellar system, through Oort's cloud a few million years ago. Because the statistical effect on the change of a comet's angular momentum about the Sun is proportional to the square of the ratio of the mass to the velocity of a star relative to the Sun, it is a priori probable that passages by a few stars should produce clustering of the aphelia, as is discussed in detail. (28 refs.)

96.50M Meteorites, micrometeorites

121611 The discovery and initial characterization of Allan Hills 81005: the first lunar meteorite. U.B.Marvin (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.775-8 (Sept. 1983).
Antarctic meteorite ALHA 81005, discovered in the Allan Hills region of Victoria Land, is a polymict anorthositic breccia which differs from other meteorites in mineralogical and chemical composition but is strikingly similar to lunar highlands soil breccias. The petrologic character and several independent lines of evidence identify ALHA 81005 as a meteorite from the Moon. Two small clasts of probable mare basalt occur among the highlands lithologies in Thin Section 81005,22. This lunar specimen, which shows relatively minor shock effects has generated new ideas on the types of planetary samples to be found on the Earth, and has added fresh excitement to the Antarctic meteorite program. (9 refs.)

121612 Regolith breccia Allan Hills A81005: evidence of lunar origin, and petrography of pristine and nonpristine clasts. P.H.Warren, G.J.Taylor, K.Keil (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.779-82 (Sept. 1983).
MnO/FeO ratios in pyroxene, texture (abundant brown, swirly glass, in general typical of lunar regolith breccias), and overall composition ($\sim$75% plagioclase) all indicate that Allan Hills A81005 is of lunar origin. It is presumably from a heretofore unsampled region of the Moon. It differs in detail from other regolith samples, e.g. it has exceptionally low contents of Na and KREEP. A pristine clast contains exceptionally coarse augite, compared to similar Apollo samples. ALHA 81005 is not perceptibily more shocked than typical Apollo regolith breccias. Therefore, its discovery on Earth lends further credence to suggestions that shergottite-nakhlite chassignite achondrites were derived by impact ejection from Mars. (22 refs.)

121613 Origin of lunar meteorite ALHA 81005: clues from the presence of terrae clasts and a very low-titanium mare basalt clast. A.H.Treiman, M.J.Drake (Lunar & Planetary Lab., Univ. of Arizona, Tucson, AZ, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.783-6 (Sept. 1983).
Petrographic data and pyroxene compositions indicate that meteorite ALHA 81005 is a breccia from the terrae of the Moon. Thin section ALHA 81005,9 includes ferroan anorthositic clasts, a lone clast of Mg-suite plutonic composition, fragments which are intermediate in composition between ferroan anorthosite and Mg-suite plutonics, and a clast of very low-titanium mare basalt. If this basalt is significantly younger than the last basin-forming impact event ($\simeq 3.9\times 10^9$ years ago), its presence probably constrains the source crater for ALHA 81005 to be within a hundred kilometers of a VLT mare basalt flow. (13 refs.)

121614 Petrology of ALHA 81005, the first lunar meteorite. S.B.Simon, J.J.Papike, C.K.Shearer (Inst. for the Study of Mineral Deposits, South Dakota School of Mines & Technol., Rapid City, SD, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.787-90 (Sept. 1983).
Petrography and mineral compositions show tha ALHA 81005 is a lunar highland regolith breccia and is the first known lunar meteorite. Lithic clasts are abundant and most are members of the anorthosite-norite-troctolite highland suite. Plagioclase compositions in lithic clasts and single grains are calcic (An_{94-98}). Pyroxene compositions, Al-Ti and MnO-FeO relationships support a lunar highland origin. A non-KREEPy source region is indicated, and the unexplored far side of the Moon cannot be ruled out as a potential source. (11 refs.)

121615 ALHA 81005: Moon, Mars, petrography, and Giordano Bruno. G.Ryder, R.Ostertag (Inst. fur Mineralogie, Univ. Munster, Munster, Germany).
Geophys. Res. Lett. (USA), vol.10, no.9, p.791-4 (Sept. 1983).
Meteorite ALHA 81005, a glassy regolith breccia, is beyond any reasonable doubt of lunar origin, according to its petrographic, chemical, and isotropic characteristics. The sample was shocked at most to 15 GPa during ejection and supports and possibility of some meteorites being of Martian origin. Most lithic fragments are feldspathic granulitic impactites, cataclastic anorthosites, and impact melts, all typical lunar lithologies. Mineral fragments are derived from plutonic troctolitic and noritic rocks, varied mare basalt-like extrusive rocks, and the identified lithic fragment types. Neither petrographically nor chemically are there significant components in ALHA 81005 which were previously unknown. A mare basalt component restricts the origin of the sample: with remotely-sensed data, which eliminates most frontside, as well as farside groundtrack regions, it makes the probability of ejection from Giordano Bruno, near the Moon's NE limb, far greater than from any other lunar crater. (14 refs.)

121616 Meteorite ALHA 81005: petrology of a new lunar highland sample. G.Kurat, F.Brandstatter (Naturhistorisches Museum, Vienna, Austria).
Geophys. Res. Lett. (USA), vol.10, no.9, p.795-8 (Sept. 1983).
Reports a study of thin-section ALHA 81005,8 using microscopy and electron microprobe analysis techniques. (18 refs.)

121617 Oxygen and silicon isotopes in ALHA 81005. T.K.Mayeda, R.N.Clayton, C.A.Molini-Velsko (Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.799-800 (Sept. 1983).
The Antarctic meteorite ALHA 81005 has oxygen and silicon isotopic compositions identical with lunar highland rocks. The oxygen is distinctly unlike that in calcium-rich achondrites. The isotopic data are entirely consistent with a lunar origin for the meteorite. (10 refs.)

121618 Trapped noble gases indicate lunar origin for Antarctic meteorite. D.D.Bogard (Planetary & Earth Sci. Div., NASA Johnson Space Center, Houston, TX, USA), P.Johnson.
Geophys. Res. Lett. (USA), vol.10, no.9, p.801-3 (Sept. 1983).
The isotopic abundances of the noble gases (He, Ne, Ar, Kr, Xe) are reported for Antarctic meteorite ALHA 81005. It contains solar wind-implanted gases whose absolute and relative concentrations are quite similar to lunar regolith samples but not to other meteorites. ALHA 81005 also contains a large excess ^{40}Ar component which is identical to the component in lunar fines implanted from the lunar atmosphere. Large concentrations of cosmogenic ^{21}Ne, ^{82}Kr and ^{126}Xe in ALHA 81005 indicate a total cosmic ray exposure age of $\geq 2\times 10^8$ years. The noble gas data alone are strong evidence for a lunar origin of this meteorite. (15 refs.)

121619 Recent cosmic ray exposure history of ALHA 81005. C.Tuniz (Istituto di Fisica, Univ. di Trieste, Trieste, Italy), D.K.Pal, R.K.Moniot, W.Savin, T.H.Kruse, G.F.Herzog, J.C.Evans.
Geophys. Res. Lett. (USA), vol.10, no.9, p.804-6 (Sept. 1983).
Measurements of the ^{10}Be and ^{26}Al contents of ALHA 81005 constrain the length and conditions of its exposure to cosmic rays. Calculations based on one-step irradiation models imply that the time spent by this object in space is shorter than that spent by most 'asteroidal' meteorites. On the other hand the results are readily consistent with a lunar origin for ALHA 81005. (21 refs.)

121620 Ferromagnetic resonance and magnetic properties of ALHA 81005. R.V.Morris (NASA Johnson Space Center, Houston, TX, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.807-8 (Sept. 1983).
Seven chips of primarily matrix material from the Antarctic meteorite ALHA 81005 were analyzed by ferromagnetic resonance (FMR) and magnetic hysteresis techniques. The FMR spectra of two chips have a resonance at g$\sim$2.1 that resembles the g$\sim$2.1 resonance that is characteristic of lunar soils. Thus the FMR spectra are consistent with the lunar regolith being a progenitor for the matrix material. For the two chips, I_s/FeO$\sim$5 units which is equivalent to a value for an immature lunar soil. The total concentration of metallic iron is on the order of 0.11 equivalent wt.% which is within the observed range of Apollo 16 rocks and soils. (17 refs.)

121621 Thermoluminescence and nuclear particle tracks in ALHA 81005: evidence for a brief transit time. S.R.Sutton, G.Crozaz (MacDonnell Center for the Space Sci., Washington Univ., St. Louis, MO, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.809-12 (Sept. 1983).
Thermoluminescence and nuclear particle track measurements have been made on the Antarctic meteorite ALHA 81005. No nuclear particle tracks were found in lithic fragments indicating that the clast material never resided at the very surface of the parent body. The unusually low natural thermoluminescence of this material is interpreted as being due to a combination of anomalous fading and thermal decay. The thermal decay could be due to very long terrestrial age or heating either during atmospheric entry, in a near-Sun orbit or during a parent body impact event. Impact heating is considered the more likely of these possibilities for this meteorite. If the impact heating interpretation is correct the thermoluminescence data constrains the space exposure time of the object to be less than 2500 years. Such a brief Earth transit time is consistent with a lunar origin for this meteorite. (17 refs.)

121622 Antarctic meteorite ALHA 81005, a piece from the ancient lunar crust. H.Palme, B.Spettel, G.Weckwerth, H.Wanke (Max-Planck-Inst. fur Chem., Mainz, Germany).
Geophys. Res. Lett. (USA), vol.10, no.9, p.817-20 (Sept. 1983).
A 128 mg sample of the Antarctic meteorite ALHA 81005 was analysed for major, and trace elements by instrumental neutron activation techniques. The meteorite, or at least its major components, may be older than 4×10^9 years and represent a piece of the ancient lunar crust, before the formation of the large basins on the front-side of the Moon. The evidence is derived from the low absolute content of incompatible elements and their slightly different fractionation pattern from KREEP, the dominant source for these elements on the front-side. The basically chondritic pattern of siderophile elements (Ni, Co, Ir, Au) is clearly distinguished from younger, basin related, meteoritic components. (24 refs.)

121623 Siderophile, lithophile and mobile trace elements in the lunar meteorite Allan Hills 81005. R.M.Verkouteren, J.E.Dennison, M.E.Lipschutz (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.821-4 (Sept. 1983).
Contents of siderophilic As, Au, Co, Ga and Sb, volatile/mobile Ag, Bi, Cd, In, Se, Te, Tl and Zn and lithophilic Cs, Rb and U determined by radiochemical neutron activation analysis in ALHA 81005 are similar to those of lunar highlands samples returned by Apollo missions, indicating this meteorite's lunar origin. Five elements (Co, Ga and lithophiles) reflect lunar crustal processes while the remaining 11 siderophile and mobile elements (including the most mobile ones) indicate $1.4\pm 0.5\%$ micrometeorite (Cl equivalent) admixture or enrichment by thermal redistribution on the Moon. Thus, in contrast to L chondrites where severe shock caused trace element loss, impact-launching of ALHA 81005 to Earth was free of substantial ($\leq$20 GPa) shock loading. In this light, a Martian origin for severely shocked shergottite-nakhlite-chassignite meteorites is plausible. (28 refs.)

121624 ALHA 81005 meteorite: chemical evidence for lunar highland origin. J.C.Laul (Dept. of Radiological Sci., Battelle, Pacific Northwest Labs., Richland, WA, USA), M.R.Smith, R.A.Schmitt.
Geophys. Res. Lett. (USA), vol.10, no.9, p.825-8 (Sept. 1983).
Based on the well-established characteristic lunar and meteoritic ratios of FeO/MnO, Cr_2O_3/V and K/La, and REE patterns, ALHA 81005 meteorite is undoubtedly of lunar highland origin. The ALHA 81005 meteorite is an anorthositic gabbro (72% Pl) and matches closely in chemical composition to Apollo 15 15418 and Luna 16 21013 highland rocks. The rock is a non-KREEPy and VLT type. The siderophiles Au, Ni and Ir content is high (1.5% Cl equivalent) and similar to other lunar highland breccias. The clast has a different ancient meteorite component than the bulk and matrix. The meteorite has a young terrestrial age implying a recent lunar cratering event. Therefore, during major lunar basins formulation in early eons, the Earth must have received a significant amount of lunar material which is now mixed in the crust. The finding of a lunar meteorite lends credibility to the suggestion that SNC achondrites may come from Mars. (30 refs.)

121625 Antarctic meteorite ALHA 81005—not just another lunar anorthositic norite. R.L.Korotev, M.M.Lindstrom, D.J.Lindstrom, L.A.Haskin (McDonnell Center for the Space Sci., Washington Univ., St. Louis, MO, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.829-32 (Sept. 1983).
Seven subsamples of meteorite ALHA 81005, a regolith breccia from the lunar highlands, have been analyzed by INAA for 32 elements. Four of them were also studied petrographically. In bulk composition the rock corresponds to anorthositic norite with a very small component of KREEP and is very similar to estimates of average lunar highlands surface. Compositions of the white clasts and the dark matrix are similar, but the clasts are more magnesium and 30-50% as rich in KREEP-related elements. The white clasts have fine-grained granulitic textures and are generally similar to Apollo 16 and 17 granulitic anorthositic norites, but are more magnesian and only 20% as rich in KREEP-related elements. Some granulitic clasts are dominated by a magnesian anorthositic norite component not represented among the 'pristine' Apollo samples. (19 refs.)

121626 Compositional implications regarding the lunar origin of the ALHA 81005 meteorite. G.W.Kallemeyn (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA), P.H.Warren.
Geophys. Res. Lett. (USA), vol.10, no.9, p.833-6 (Sept. 1983).
Geochemically, ALHA 81005 has all the attributes expected of a regolith sample from the lunar highlands. Most important is its Fe/Mn ratio (77), within uncertainty the same as the mean lunar ratio. There are significant differences, however, in comparison to previously sampled lunar regoliths. The closest precedents are the Apollo-16 and Luna-20 regoliths, particularly the latter, but ALHA 81005 has lower contents of Na, Ti, and incompatible elements. Feldspathic granulitic breccias such as 72559, which texturally resemble the most abundant type of clast in ALHA 81005, are also similar compositionally. From its low KREEP and Na contents ALHA 81005 originated well away from the K, Th, and U-rich region near the center of the nearside, at least as far away as the eastern limb. (24 refs.)

121627 Composition of bulk samples and a possible pristine clast from Allan Hills A81005. W.V.Boynton, D.H.Hill (Lunar & Planetary Lab., Univ. of Arizona, Tucson, AZ, USA).
Geophys. Res. Lett. (USA), vol.10, no.9, p.837-40 (Sept. 1983).
Abundances of thirty-five elements were determined in two bulk samples and a white clast in the Allan Hills A81005 meteorite. High siderophile element content indicates that the sample is a regolith breccia. An Fe/Mn ratio of 77 in this meteorite eliminates parent bodies of known differentiated meteorites as the source of ALHA 81005. The incompatible elements are very similar to those found in most lunar highlands rocks, and provide very strong evidence that the sample is lunar in origin. The clast sample has the trace element pattern of a lunar anorthosite and is very low in KREEP and siderophile elements. It may be a fragment of a pristine lunar rock. (12 refs.)

121628 Al-Sm-Eu-Sr systematics of eucrites and Moon rocks: implications for planetary bulk compositions. P.H.Warren (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.9, p.1559-71 (Sept. 1983).
Analysis of the Eu and Sr 'anomalies' of eucrites and lunar rocks allows constraints to be placed on the bulk compositions of the eucrite parent body (EPB) and the Moon. The elements Al, REE, and Sr, all are essentially incompatible with the major minerals of these small, low-f (O_2) bodies, except for plagioclase, into which Al, Sr, and Eu tend to concentrate. Therefore, the hypothesis that Al, REE, and Sr in the EPB and the Moon are all in proportions close to those in the bulk solar system (i.e. chondrites) leads to certain predictions about the concentrations of these elements in samples affected by plagioclase fractionation. the predictions are almost ideally fulfilled by eucrites and lunar samples. (100 refs.)

121629 Cumberland Falls chondritic inclusions. II. Trace element contents of forsterite chondrites and meteorites of similar redox state. R.M.Verkouteren, M.E.Lipschutz (Dept. of Chem., Purdue Univ., W. Lafayette, IN, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.9, p.1625-33 (Sept. 1983).
For pt.I see ibid., vol.45, no.11, p.2091-107 (1981). Mineralogic study of black inclusions in the Cumberland Falls enstatite achondrite revealed that they constitute a highly unequilibrated chondritic suite distinct from other chondrite groups. This highly shocked suite, the forsterite (F) chondrites, exhibits mineralogic trends apparently produced during primary nebular condensation and accretion over a broad redox range. These samples and possibly related meteorites are analysed for Ag, As, Au, Bi, Cd, Co, Cs, Ga, In, Rb, Sb, Se, Te, Tl, U and Zn. Chemical trends in F chondrites apparently reflect primary nebular processes. Cosmochemical fractionation of lithophiles from siderophiles and chalcophiles occurred at moderately high temperatures, certainly higher than those existing during formation of primitive carbonaceous, enstatite and ordinary chondrites of petrologic type ≤ 3. (48 refs.)

121630 FUN with PANURGE: high mass resolution ion microprobe measurements of Mg in Allende inclusions. J.C.Huneke, J.T.Armstrong, G.J.Wasserburg (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.9, p.1635-50 (Sept. 1983).
The performance characteristics of PANURGE, a modified CAMECA IMS3F ion microprobe, have been studied at a mass resolving power of 5000. Using this instrument the isotropic composition of Mg and Si and the atomic ratio of Al/Mg in minerals from the Allende inclusion WA and the Allende FUN inclusion C1 have been measured. Enrichments in ^{26}Mg of up to $260^0\%$ have been found. Mg and Al/Mg measurements on cogenetic spinel inclusions and host plagioclase crystals yield Mg/Al isochrons in excellent agreement with precise mineral isochrons determined by thermal emission mass spectrometry. The measurements confirm the presence of substantial excess ^{26}Mg in WA and its near absence in C1. This suggests a metamorphic reequilibration of Mg in Allende plagioclase at least 0.6 my after WA formation. (42 refs.)

121631 Description, chemical composition and noble gases of the chondrite Nogata. M.Shima, S.Murayama (Nat. Sci. Museum, Tokyo, Japan), A.Okada, H.Yabuki, N.Takaoka.
Meteoritics (USA), vol.18, no.2, p.87-102 (30 June 1983).
An ordinary chondrite weighing 472 g kept in the Shinto shrine, Suga Jinja, Nogata-shi, Fukuoka-ken, Japan, as treasure, was said to have fallen in the precinct of the shrine, approximately 130°45.0′E and 33°43.5′N, on May 19, 861 AD. The data of fall was confirmed by old literature, as well as written script on, and ^{14}C age determination of, the lid of the wooden box in which it has been stored. The chondrite was named Nogata after the present name of the place of fall. Chemical analyses indicate that Nogata is an L-group chondrite. It is classified as petrologic type 6. Nogata contains rather high amounts of both radiogenic and spallogenic light noble gases, and gives gas retention ages and cosmic-ray-exposure ages of 4.5 and 4.7×10^9 and 4.00×10^7 years, respectively. It is concluded that metamorphism of this chondrite was completed just after the formation of the parent body in a very short interval, $\lesssim 10^8$ years, with subsequent quiescence. (43 refs.)

121632 The nomenclature of polymict basaltic achondrites. J.S.Delaney, H.Takeda, M.Prinz, C.E.Nehru, G.E.Harlow (Dept. of Mineral Sci., American Museum of Natural History, New York, NY, USA).
Meteoritics (USA), vol.18, no.2, p.103-11 (30 June 1983).
The subgroups within the basaltic achondrite suite are defined using the structural criterion of Wahl (1952). The 'monomict' meteorites are samples of a single lithology while the polymict meteorites are those containing two or more lithologies. The 'monomict' subgroups; eucrites, cumulate eucrites and diogenites are subdivided into both brecciated and unbrecciated meteorites. The polymict achondrites sample a petrological-compositional continuum that contains both mafic and ultramafic rock types and may be subdivided into several groups. Two groups of polymict basaltic achondrites, the polymict eucrites and howardites are separated using an arbitrarily defined criterion. The recommended criterion is based on the amount of magnesium orthopyroxenite (diogenite) component in the meteorite. (36 refs.)

121633 The Atlanta enstatite chondrite breccia. A.E.Rubin (Dept. of Mineral Sci., Nat. Museum of Natural History, Washington, DC, USA).
Meteoritics (USA), vol.18, no.2, p.113-21 (30 June 1983).
Atlanta is the fifth known brecciated enstatite chondrite. It contains a centimeter-sized troilite-rich clast, similar to those that occur in Blithfield. All of these clasts probably formed in the solar nebula under high pS_2/pO_2 conditions in a gas of non-cosmic composition. The absence of ordinary or carbonaceous chondrite clasts in any of the enstatite chondrite breccias and absence of enstatite chondrite clasts or materials formed at high pS_2/pO_2 ratios in ordinary and carbonaceous chondrite breccias support the model that enstatite chondrites were formed at a location distant from those of the other chondritic groups. (20 refs.)

121634 Lithium in stone meteorites and stony irons. S.V.S.Murty, P.N.Shukla, P.S.Goel (Dept. of Chem., Indian Inst. of Technol., Kanpur, India).
Meteoritics (USA), vol.18, no.2, p.123-36 (30 June 1983).
Lithium contents have been determined by neutron activation analysis in 54 meteorites distributed as: C(9), H(13), L(10), LL(3), E(2), achondrites (11), and stony irons (6). Among the undifferentiated meteorites Li contents range from 1 to 3 ppm. Li contents are higher in Ca-rich achondrites and mesosiderites than in Ca-poor achondrites and pallasites respectively. Among achondrites, Li correlates positively with Ca and Al and inversely with Mg. A minor Li-rich phase might be associated with the plagoclase component of achondrites. In several meteorites, Li concentration is determined in magnetic and nonmagnetic fractions, chondrules, and light and dark components (for the gas-rich meteorites). (44 refs.)

121635 Brianza: an example of wrongly believed chondrite. G.R.Levi-Donati (Istituto Tec. Ind. di Stato A. Volta, Perugia, Italy), R.S.Clarke,Jr..
Meteoritics (USA), vol.18, no.2, p.165-6 (30 June 1983).
The results obtained from the specimen labelled Brianza revealed that it is an artificial iron and not a chondritic meteorite, as previously supposed. (4 refs.)

121636 Fe-Ni-S-O layer phase in C2M carbonaceous chondrites—a hydrous sulphide?. D.J.Barber (Phys. Dept., Univ. of Essex, Colchester, England), A.Bourdillon, L.A.Freeman.
Nature (GB), vol.305, no.5932, p.295-7 (22 Sept. 1983).
It has been suggested (McSween, 1979, and Bunch and Chang 1980) that the matrix minerals of type C2M carbonaceous meteorites are the products of aqueous alteration in a parent-body regolith. Phases occur within the matrix which differ from those commonly found in cases of terrestrial aqueous alteration and provide clues to the history of the meteorites. Poorly-characterized phases $(PCP)^3$ containing Fe, Ni, S, O and sometimes Cr, were first noted in the Murchison meteorite. Barber (1981) found that amongst PCP there was a layer phase, rich in Fe, Ni, S and thought to contain oxygen, commonly having a fibrous or platey morphology, with a layer spacing of approximately 10.8 and 5.4 Å. The authors report new data on this phase, obtained by high resolution electron microscopy, dispersive X-ray spectrometry and electron energy loss spectrometry. (19 refs.)

121637 Martian gases in an Antarctic meteorite?. D.D.Bogard, P.Johnson (Planetary & Earth Sci. Div., NASA Johnson Space Center, Houston, TX, USA).
Science (USA), vol.221, no.4611, p.651-4 (12 Aug. 1983).
Significant abundances of trapped argon, krypton and zenon have been measured in shock-altered phases of the achondritic meteorite Elephant Moraine 79001 from Antarctica. The relative elemental abundances, the high ratios of argon-40 to argon-36 ($\geq$2000), and the high ratios of xenon-129 to xenon-132 ($\geq$2.0) of the trapped gas more closely resemble Viking data for the Martian atmosphere than data for noble gas components typically found in meteorites. These findings support earlier suggestions, made on the basis of geochemical evidence, that shergottites and related rare meteorites may have originated from the planet Mars. (25 refs.)

96.60 SOLAR PHYSICS

121638 Oscillator strengths of titanium and chromium ionic lines. R.I.Kostyk, T.V.Orlova.
Astrometriya & Astrofiz. (USSR), no.49, p.39-41 (1983). In Russian.
Oscillator strengths for 27 Ti II and 29 Cr II lines are determined from the solar spectrum with suggested accuracy of ±0.15 dex. (15 refs.)

121639 Sounding of the supercorona by decametric radiation of 3C 144. E.P.Abranin, L.L.Bazelyan.
Astrometriya & Astrofiz. (USSR), no.49, p.41-7 (1983). In Russian.
Angular intensity distributions are presented for the 3C 144 source measured at 25 MHz during its occultation by the solar corona. The distributions obtained are compared with those calculated for the case of a spherically symmetric solar corona with irregularities elongated in radial directions. Application of the mean and scattering solar corona's model elongated in equatorial plane is shown to be necessary for explanation of the distribution observed. (4 refs.)

121640 Annual variation of the mean magnetic field of the Sun. V.A.Kotov, L.S.Levitskii, N.N.Stepanyan.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.1-14 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.3-14 (1981). [received: Oct. 1983]
Measurements of the mean magnetic field of the Sun, seen as a star, were carried out between 1968 and 1978 at three observatories. Analysis of these data have shown that the mean magnetic field (MMF) exhibits a clear annual periodicity with an amplitude of about 0.1 G. An analogous annual wave has also been found in the background field determined from sunoptic Hα-charts. This annual periodicity cannot be ascribed to instrumental or seasonal factors. In contrast to the polar field the variation in the solar MMF cannot be explained in a purely geometric fashion because this leads to a large discrepancy with direct observations. The origin of this annual variation remains an open question. (33 refs.)

121641 Quasiperiodic oscillations in the solar atmosphere. A.G.Kosvichev, Yu.P.Popov.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.15-26 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.15-24 (1981). [received: Oct. 1983]
The propagation of disturbances through the convective zone and the atmosphere of the Sun is investigated with the aid of numerical methods applied to the equations of one-dimensional gravitational gas-dynamics. It is shown that the inhomogeneity of the solar plasma in the gravitational field gives rise to oscillations in the solar atmosphere with a period of about 300 sec. The effect of nonlinearity on the nature of these oscillations is established. The results obtained are compared with observational data. (18 refs.)

121642 The structure of the magnetic field and its evolution in the neighbourhood of sunspots. S.I.Gopasyuk, L.G.Kartashova.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.27-47 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.25-54 (1981). [received: Oct. 1983]
The structure of the magnetic field and its evolution have been investigated in the neighbourhood of large single sunspots. Charts of the longitudinal magnetic field at the level of the photosphere and Hα-photographs of 18 active

regions were employed. For five active regions the data were augmented with X-ray photographs of the Sun. It is shown that an active region contains characteristic directions along which the spot field varies withut change of sign as it passes into an extended field region of the same polarity. These directions correspond to channels along which the magnetic lines of force leave and active region or close upon it. (18 refs.)

121643 Structure of the magnetic field and flare activity in the active region McMath 9740 (October 1968). M.B.Ogir, T.T.Tsap.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.48-67 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.46-65 (1981). [received: Oct. 1983]
The active region McMath 9740 was investigated between 26 October and 2 November 1968. The longitudinal and transverse components of the solar magnetic field were recorded in the Fe I 5250 Å line. These measurements were accompanied by simultaneous Hα-cinematography. It was found that flares of size Sn or higher were grouped in definite time intervals, forming flare series. All the first appearances of flares were located very close to the neutral line of the longitudinal magnetic field; strong flares appeared at points corresponding to strong transverse fields. (41 refs.)

121644 Nature of solar radio burst spectra in frequency band 0.245-35 GHz. T.K.Das, M.K.Das Gupta (Centre of Advanced Study in Radio Phys. & Electronics, Calcutta, India).
Indian J. Radio & Space Phys., vol.12, no.3, p.68-73 (June 1983).
A total of 132 solar radio burst spectra in the frequency band 0.245-35 GHz are classified into 15 distinct types according to the nature of variation of emission intensity with the observed frequencies. Of these 15 types, IU-IU, IU-I, D-IU, D-I and U-IU occur most. They generally have the most pronounced peaks at 0.245-0.606 GHz and the less pronounced peaks at around 8.8 GHz. The mean spectral indices in the ranges of frequencies 0.245-0.606, 1.415-2.695 and 4.995-15.4 GHz are 2.7, 1.3 and 1.0, respectively. In the decimetre-wave region the burst having U-shaped spectra correlate well with type II metre-wave bursts and proton events, and the bursts having LS-shaped spectra with type III bursts. In the centimetre-wave region. IF-type spectra are associated with type III bursts and proton events and the D-type ones with type II bursts. The spectral shapes are interpreted. (27 refs.)

121645 On propagation of magneto-acoustic-gravity waves in the solar atmosphere. N.S.Dzhalilov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.90-8 (1983). In Russian.
The coupling of magneto-acoustic-gravity waves (MAG) at the sharp boundary between two isothermal atmospheres which are perpendicular to the magnetic field is investigated. The energetic and amplitude reflection, transmission and transformation coefficients for MAG waves incident on a temperature step are calculated. The results of the investigation are used for the evaluation of the wave flux and the wavelengths crossing the transition layer of the Sun's atmosphere. (18 refs.)

121646 Simultaneous acceleration of electrons and ions in solar flares. D.J.Forrest, E.L.Chupp (Univ. of New Hampshire, Dept. of Phys., Durham, NH, USA).
Nature (GB), vol.305, no.5932, p.291-2 (22 Sept. 1983).
Two very intense and impulsive nuclear γ-ray and electron bremsstrahlung X-ray emitting solar flares, on 7 and 21 June 1980, were observed with <2 s time resolution. These observations allow the authors to study the relative starting times of energetic ion and electron interactions with the solar atmosphere. The simultaneous starting times of X-rays$>$40 keV and γ-ray emission show that electrons and ions were accelerated within seconds of each other. The near simultaneous peaking, together with the observation of $>$400 MeV neutrons, show that the solar flare acceleration process can produce the full intensity and spectrum of electrons ($>$1 MeV) and ions ($>10^2$ MeV) in a time scale of <5 s. (18 refs.)

121647 Successive electron and ion accelerations in impulsive solar flares on 7 and 21 June 1980. H.Nakajima, T.Kosugi, K.Kai (Nobeyama Solar Radio Obs., Tokyo Astron. Obs., Nagano-ken, Japan), S.Enome.
Nature (GB), vol.305, no.5932, p.292-4 (22 Sept. 1983).
A study of the relative timing of solar flare emissions at different wavelengths can provide valuable insights into the associated particle-acceleration mechanisms. The authors report that the significant systematic differences between the times of occurrence of the peak intensities of microwave, hard X-ray and γ-ray line emissions, which were found in two impulsive flares on 7 and 21 June 1980 at 0312 and 0118 UT respectively, suggest that two kinds of acceleration take place successively within a few seconds. (10 refs.)

121648 Neutrino astrophysics and neutrino rest mass. II. Solar neutrinos and stellar collapse neutrinos. T.Kirsten (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Phys. Bl. (Germany), vol.39, no.9, p.313-17 (Sept. 1983). In German.
This part deals with experiments for the detection of solar neutrinos. Only fusion-generated neutrinos, because of their minimal interaction with matter, permit a glimpse of the otherwise inaccessible solar interior, and provide a test of the author's theories of stellar structure. The neutrino mass is of importance, because of the possible oscillation between neutrino types which could affect measurements of the solar neutrino flux. Even with a rest mass corresponding to less than 10^{-3} eV, a gallium detector should yield information in this area. To conclude, neutrino pulses from the collapse of dying stars are discussed. (10 refs.) *G.F.F.*

121649 27-day variations observed in solar UV (120-300 nm) irradiance. G.J.Rottman (Lab. for Atmospheric & Space Phys., Univ. of Colorado, Boulder, CO, USA).
Planet. & Space Sci. (GB), vol.31, no.9, p.1001-7 (1983). (European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere, Leeds, England, 23-27 Aug. 1982).
A Fourier transform analysis of 256 days of SME solar irradiance data (115-303 nm) provides an estimate of the root mean square 27-day solar variation. The magnitude of this 27-day variation exceeds ±10% at 120 nm and decreases with increasing wavelength to less than 1% above 260 nm. Qualitative aspects of the analysis include a striking decrease in the per cent variation across the aluminium absorption edge near 208 nm. (7 refs.)

121650 Neutrino spectroscopy of the solar core. Yu.S.Kopysov.
Priroda (USSR), no.8, p.59-69 (1983). In Russian.
The author traces the history of attempts to detect and measure the streams of neutrinos generated by the nuclear reactions taking place in the Sun, and traversing space at the speed of light. The author then discusses in detail the astrophysical and nucleophysical aspects of the problem of detection and measurements of solar neutrinos, in particular that of using the data so obtained to model and explain the structure of the Sun. The author proposes an explanation of pulsing neutrino streams based on tidal-type oscillations of the solar substance. An account is given of the detection equipment and the methods to be used at the nearly completed solar neutrino observatory at Andyrcha in the USSR. (no refs.) *A.J.B.*

121651 Infrared observations of the thermal emission from the corona. A.Mampaso, C.Sanchez-Magro (Inst. de Astrofisica de Canarias, Univ. de La Laguna, La Laguna, Tenerife, Spain), M.J.Selby, A.D.MacGregor.
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.3-6 (June 1983).
During the summer of 1978 the F Corona was observed from the ground in the near infrared at 2.2 μm and 3.5 μm in an attempt to measure the localized thermal emission from dust predicted by Peterson (1963) and several other workers. The authors failed to detect this emission even though their experimental errors were well below previously quoted emission values. If thermal emission peaks around the Sun exist, the authors believe they are either much weaker or have different shapes compared to previous ones found. This result, if confirmed, will require a revision of the dynamics and physics of circumsolar dust. (19 refs.)

121652 Development of flare morphology in X-rays, and the flare scenario. C.de Jager (Kyoto Univ., Kyoto, Japan).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.21-32 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Defines the impulsive phase of a flare as its first phase, characterized by: X-ray bursts of short (seconds to tens of seconds) duration, a patchy X-ray morphology, and injection of energy. It lasts some five to ten minutes. The gradual or diffuse phase starts virtually at the same time as the impulsive one and is characterized by a gradually varying X-ray flux from a larger, diffuse, area situated higher than the sources of the impulsive X-ray bursts. It contains about the same number of energetic electrons as the impulsive burst patches contained initially. It cools gradually down by radiative and conductive losses, a process that may last for about an hour. (11 refs.)

121653 Magnetic theories of solar flares. E.R.Priest (Appl. Math. Dept., Univ. of St. Andrews, St. Andrews, Scotland).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.33-45 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The basic processes of evaporation and magnetic reconnection are developed. They may be important in the two main types of flaring event, namely simple-loop flares and two-ribbon flares. The first type could be produced by kink instability, thermal nonequilibrium, or emerging flux. The second type is thought to be the result of an eruptive MHD instability that is either spontaneous or triggered from outside. After the eruption the magnetic field lines that have been blown open reconnect back down in a way that has now been simulated numerically. (50 refs.)

121654 Solar flare X-ray spectra from the P78-1 spacecraft. G.A.Doschek (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.49-58 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Results from the high resolution solar X-ray spectrometer experiments on the P78-1 spacecraft are discussed. These results concern physical quantities such as electron temperature and density, turbulence, mass motions, and state of ionization equilibrium, characteristic of the thermal soft X-ray emitting flare plasma, and the time behavior of these quantities during flares. In addition, a brief description of the instruments is given, the plasma diagnostics used in interpreting the spectra are summarized, and the origin of the thermal soft X-ray emitting plasma is discussed in light of the P78-1 results, earlier data, and numerical simulations of magnetic flux tubes heated to solar flare temperatures. (21 refs.)

121655 Non-thermal and non-equilibrium effects in soft X-ray flare spectra. A.H.Gabriel (Rutherford Appleton Lab., Chilton, Didcot, England), E.Antonucci, L.Steenman-Clark.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.59-66 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Processes leading to the excitation of soft X-ray line spectra are discussed in relation to their thermal or non-thermal nature. Through analysis of calcium spectra from the XRP experiment on SMM, it is shown that the ionization balance during the gradual phase of flares is effectively in the steady-state. A search of suitable complex flares with multiple impulsive features has shown indications of soft X-ray line intensity anomalies, consistent with the presence of a non-thermal electron component. (10 refs.)

121656 Observation of chromospheric evaporation during the Solar Maximum Mission. E.Antonucci (Univ. di Torino, Torino, Italy), B.R.Dennis.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.67-77 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
A sample of flares detected in 1980 with the Bent Crystal Spectrometer and the Hard X-ray Burst Spectrometer on the Solar Maximum Mission satellite are analysed to study the upward motions of part of the soft X-ray emitting plasma. These motions are inferred from the presence of secondary blue-shifted lines in the Ca XIX and Fe XXV spectral regions during the impulsive phase disk flares. The temporal association of these upward motions with the rise of the thermal phase and with the impulsive hard X-ray burst, as well as considerations of the plasma energetics, favour the interpretation of this phenomenon in terms of chromospheric evaporation. The two measureable parameters of the evaporating plasma, emission measure and velocity, depend on parameters related to the energy deposition and to the thermal phase. (9 refs.)

121657 Transport and containment of plasma, particles and energy within flares. L.W.Acton, W.A.Brown, M.E.C.Bruner, B.M.Haisch, K.T.Strong (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.79-90 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Results from the analysis of flares observed by the Solar Maximum Mission (SMM) and a recent rocket experiment are discussed. The authors find evidence for primary energy release in the corona through the interaction of magnetic structures, particle and plasma transport into more than a single magnetic structure at the time of a flare and a complex and changing magnetic topology during the course of a flare. The rocket data are examined for constraints on flare cooling, within the context of simple loop models. These results form a basis for comments on the limitations of simple loop models for flares. (27 refs.)

121658 Interpretation of the soft X-ray spectra from Hinotori. K.Tanaka (Tokyo Astron. Obs., Univ. of Tokyo, Tokyo, Japan), N.Nitta, K.Akita, T.Watanabe.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.91-100 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Presents analyses of the soft X-ray iron line spectra of flares obtained from the Bragg spectrometer on Hinotori. The authors present a case of strong K_α

emission at the impulsive phase of the hard X-ray burst, and assess net K_α emission due to the electron impact by eliminating the fluorescence contribution. The authors discuss the differences in the electron temperatures and emission measures derived respectively from Fe XXVI and Fe XXV spectra. A pilot two-temperatures model which can explain the two spectra is presented. The authors compare the temporal relations between the soft X-ray and hard X-ray intensities and show two extreme classes of flares. Energetical relation of the thermal plasma to the electron beam is discussed for the two classes. (17 refs.)

121659 Polarization measurements using the Bragg crystal spectrometers on Hinotori. K.Akita (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan), K.Tanaka, T.Watanabe.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.101-5 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The two Bragg crystal spectrometers on board Hinotori provide a new technique for measuring linear polarization of the soft X-ray line emission from solar flares. The results of the measurements of large (X class) flares are given and the polarization degree averaged over the soft X-ray maximum phases is estimated. (8 refs.)

121660 Thermal evolution of flare plasma. T.Watanabe, K.Tanaka (Tokyo Astron. Obs., Univ. of Tokyo, Tokyo, Japan), K.Akita, N.Nitta.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.107-13 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The evolution of hot thermal plasma in solar flares is analyzed by a single-temperature model applied to continuum emission in the 5 keV$<E<$13 keV spectral range. The general trend that the thermal plasma observed in soft X-rays is heated by the non-thermal electrons that emit as the hard X-ray bursts is confirmed by the observation of an electron temperature increase at the time interval of hard X-ray spikes and a quantitative comparison between thermal energy content and hard X-ray energy input. Non-thermal electrons of 10 keV$<E<$30 keV energy may play an important role in pre- and post-burst phases. (5 refs.)

121661 Conductive flux in the chromosphere derived from line linear polarization observations. J.-C.Henoux, G.Chambe, D.Heristchi, M.Semel (Obs. de Paris, Meudon, France), B.Woodgate, D.Shine, J.Beckers.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.115-22 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Linear polarization in two chromospheric lines (Hα and S I 1437 A) was observed in the gradual phase of solar flares. This polarization could be due to collisional excitation of hydrogen and S I by energetic electrons beamed in the vertical direction. The heat flux in the region connecting the transition zone to the high chromosphere during the gradual phase of a flare could lead to an anisotropic excitation. Selecting a function which represents the velocity distribution of electrons carrying heat flux, the relationship between conductive heat flux and linear line polarization is computed. The application of the relationship between linear polarization and heat flux to the observed degree of polarization leads to the determination of the conductive heat flux in the high chromosphere. (12 refs.)

121662 Upper limits on the total radiant energy of solar flares. H.S.Hudson (Center for Astrophys. & Space Sci., Univ. of California, La Jolla, CA, USA), R.C.Willson.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.123-30 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Establishes limits on the total radiant energy of solar flares during the period 1980 February-November, using the solar-constant monitor (ACRIM) on board the Solar Maximum Mission. Typical limits amount to 6×10^{29} erg/s for a 32-second integration time, with 5 σ statistical significance, for an impulsive emission; for a gradual component, about 4×10^{32} ergs total radiant energy. The limits lie about an order of magnitude higher than the total radiant energy estimated from the various known emission components, suggesting that no heretofore unknown dominant component of flare radiation exists. (12 refs.)

121663 Energetic electrons as an energy transport mechanism in solar flares. A.G.Emslie (Dept. of Phys., Univ. of Alabama, Huntsville, AL, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.133-46 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Reviews the observations and theory relating to the role of energetic electrons in the solar flare, with particular emphasis on discriminating between 'thermal' and 'nonthermal' origins of these electrons. The author discusses diagnostics in hard X-rays, especially those relating to the recent observations of the SMM and Hinotori satellites. He briefly addresses the response of the atmosphere to energy input in the form of high energy electrons, in particular through the diagnostics of both the Fe Kα feature and optically thin transition region lines such as OV. He finally discusses the relative roles of electron and proton heating in γ-ray flare events. (75 refs.)

121664 Hydrodynamics of flaring loops: SMM observations and numerical simulations. R.Pallavicini (Osservatorio Astrofisico di Arcetri, Firenze, Italy), G.Peres.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.147-57 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The hydrodynamic response of confined magnetic structures to strong heating perturbations is investigated by means of a time-dependent one-dimensional code which incorporates the energy, momentum and mass conservation equations. The entire atmospheric structure from the chromosphere to the corona is taken into account. The results of model calculations are compared with observations of flares obtained with the X-ray polychromator experiment on the solar maximum mission. (8 refs.)

121665 Behavior of transition-region lines during impulsive solar flares. E.Tandberg-Hanssen, E.Reichmann (NASA/MSFC, Al, USA), B.Woodgate.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.159-71 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Describes the ultraviolet spectrometer and polarimeter on the solar maximum mission and discusses data pertaining to the emissions observed in lines originating in the transition-region plasma, particularly during impulsive flares. The data pertain to lines from the following ions: Si II, C IV, O IV, Si IV, O V, and Fe XXI. (13 refs.)

121666 The optical flare. H.Zirin (Big Bear Solar Obs., California Inst. of Technol., Pasadena, CA, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.173-84 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Optical observations now present considerable information on the flare process. It is always associated with filaments and with simplification of existing magnetic connections, and it arises from the emergence and expansion of new flux. The optical flare divides into impulsive phase, with multiple flashes along the neutral line, and thermal phase, with two-ribbon expansion. The former bears some resemblance to tearing mode phenomena. The appearance of loops in emission requires very high densities in those phenomena. (12 refs.)

121667 Observation of the flare of 12 June 1982 by Norikura coronagraph and Hinotori. E.Hiei, T.Okamoto, K.Tanaka (Tokyo Astron. Obs., Univ. of Tokyo, Tokyo, Japan).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.185-91 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Flare activity was observed near the limb with two coronagraphs at the Norikura Solar Observatory and the soft X-ray crystal spectrometer (SOX) aboard Hinotori. A prominence activation occurred and then H_α brightenings were seen on the disk near the prominence. The prominence became very bright and its electron density increased to $10^{12.8}$ cm^{-3} in 1/2 hour. Loop prominence systems appeared above the H_α brightenings about half an hour after the onset of the flare, and were observed in the coronal lines Ca XV 5694 Å, Fe XIV 5303 Å, and Fe X 6374 Å. Shifted and asymmetric profiles of the emission line of 5303 Å were sometimes observed, and turbulent phenomena occurred even in the thermal phase. The energy release site of the flare at the onset would be lower than 20000 km above the solar limb. (7 refs.)

121668 Positional measurements on the eruptive loop prominence of 27 April 1981 and comparison with the X-ray sources. Li Su-Cuan (Yunnan Astronomical Obs., Acad. Sinica, Kunming, China), Cao Tian-Jun.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.197-202 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Using the Hα observational data from Yunnan Observatory, the authors have made position measurements on the eruptive loop prominence of 27 April 1981, and compare the results with the positions of X-ray sources obtained by the hard X-ray telescope (SXT) on board the Hinotori satellite. From the results of measurement and comparison, it is suggested that: (1) The two mounds A and C at 0830 UT are extensions of two ribbons in the flare near the limb, which started before 0758 UT. (2) The central positions of two X-ray sources at 0756 UT are just situated at the top of the mound A and the mound C, respectively. The Hα footpoint corresponding to the main source of X-rays was behind the solar limb. The second source of X-rays corresponds to C_1 and C_2. (3) The X-ray sources were probably located near the footpoints of loops. (7 refs.)

121669 Spatial characteristics of microwave bursts. M.R.Kundu (Astron. Program, Univ. of Maryland, College Park, MD, USA).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.205-17 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
The spatial characteristics of microwave bursts are discussed in relation to impulsive and post-burst phases. The existence of two components in the impulsive phase is discussed from the WSRT high time and spatial resolution observations. Evidence is presented for homologous flares at 6 cm. Preflare changes in microwave active regions are discussed. High spatial resolution observations of the structure of microwave flaring loops are presented. Theoretical interpretation of the confinement of microwave producing energetic electrons in the coronal part of loops is discussed. The relative timing of the peaks of impulsive hard X-ray and microwave burst is discussed. Possible diagnostics of impulsive phase onsets from cm-λ polarization data are presented. (18 refs.)

121670 Dual frequency observations of flares with the VLA. G.A.Dulk, T.S.Bastian (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA), G.J.Hurford.
Sol. Phys. (Netherlands), vol.86, no.1-2, p.219-26 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Describes observations of three flares made at 5 and 15 GHz with the VLA, two subflares near the limb on 1981 November 21 and 22, and an M7.7 flare on 1981 May 8. Even though the time histories of the November flares indicated simple impulsive bursts, the VLA observed no 5 GHz radiation at all from one flare, and from the other, the 15 GHz radiation emanated from a source which was smaller, lower and displaced from the 5 GHz source. The 1981 May 8 flare was intense and complex, having two or more sources at both 5 and 15 GHz. Prior to the peak of the flare, the sources grew in size to $>20''$ to $40''$, after which they were not visible to the VLA; only (weak) subsources could be seen. Highly polarized, bursty radiation observed at Toyokawa at 1 and 2 GHz, indicated that an electron-cyclotron maser operated during the flare. (5 refs.)

121671 Dissipative thermal models for impulsive microwave burst delays. J.C.Brown (Dept. of Astron., Univ. of Glasgow, Glasgow, Scotland).
Sol. Phys. (Netherlands), vol.86, no.1-2, p.227-30 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).
Microwave emission is analysed for a source heated by magnetic dissipation. As the temperature rises and the field falls, the resulting variation in microwave optical depth results in time delays between emission features at different frequencies. A single such source can, however, only explain events exhibiting small delays ($\simeq1$ sec) and with lower frequencies peaking later. Continuous production of many such heated regions (multiple kernel model) can, however, explain long delays and produce either advancement or retardation of lower frequencies. (7 refs.)

121672 Solar flares and shock waves. A.Maxwell (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Sky & Telesc. (USA), vol.66, no.4, p.285-9 (Oct. 1983).
The initial stages of flares in the solar chromosphere and lower corona were described by Kundu (1982). The author concentrates on the spectacular, large-scale phenomena that are subsequently observed in the outer corona, and also on how solar physicists have developed models that attempt to simulate these events. (no refs.)

97.00 STARS

97.10 STELLAR CHARACTERISTICS

121673 The nature of the Yale common-proper motion groups of stars. P.K.Lu (College Obs., Western Connecticut State Univ., Danbury, CT, USA), W.S.Tsay.
Astron. J. (USA), vol.88, no.9, p.1367-75 (Sept. 1983).
Image-tube spectral classification and intermediate-band photometry on the DDO system were obtained for 180 southern stars from the Yale common proper motion groups. Lu (1982) presented detailed information and the rationale to show some evidence of a moving group of 94 stars. This study reports on one large group of approximately 90 stars, two intermediate groups of about 20-30 stars, and 12 smaller groups, each of a few stars. Spectroscopic and photometric analyses of these groups indicated, in their color-magnitude diagrams, a very scattered Pop I main sequence; for each of the larger groups, a small giant branch may also be present. Distance moduli of 5 mag or less were derived for these groups from the average spectroscopic parallaxes which are consistent with the amplitude of the proper motion of 0.100″/yr. The main sequence of each of these groups shows scatter when plotted in a HR diagram. This indicates that these groups are not likely to be homogeneous groups of stars with common physical origins. Kinematical studies of the groups are in progress. (20 refs.)

121674 A theoretical starspot model. K.Jahn (Warsaw Univ. Obs., Warsaw, Poland).
Acta Astron. (Poland), vol.33, no.1, p.47-77 (1983).
Presents a model of monopoloidal and axisymmetric spot with an untwisted configuration of the magnetic field. The influence of the magnetic field on the gas is described using the assumption that the magnetic field partially inhibits convective-energy transport. A series of starspot models is computed for a zero-age main sequence star of one solar mass. The models are described by three free parameters: the total magnetic flux, the effective temperature of the spot and the position of the spot bottom. The maximum value of the surface magnetic intensity has been found as a function of the effective temperature difference between the spot and undisturbed photospheres. (18 refs.)

121675 Transonic accretion flow in a thin disk around a black hole. II. B.Muchotrzeb (N. Copernicus Astron. Center, Polish Acad. of Sci., Warsaw, Poland).
Acta Astron. (Poland), vol.33, no.1, p.79-87 (1983).
For pt.I see ibid., vol.32, no.1-2, p.1-11 (1982). Models of 'alpha-disks' accreting onto a 10 $M_\odot$ black hole at different accretion rates less than or equal to a critical rate are presented and discussed. The disk is almost Keplerian at $r=100\ r_g$ and behaves smoothly in the sonic point. In the case of small a the boundary conditions assure uniqueness of the solution, with the position of the sonic point r_s between r_{mb} and r_{ms}. For larger a up to a^*, r_s approaches r_{ms}. a^* is of the order of 0.02 and weakly depends on accretion rate. Stationary solutions for $a>a^*$ do not exist. (12 refs.)

121676 Barium, magnesium and iron in seven chemically unevolved stars and the nuclear evolution of the galactic disk. W.Steenbook (Inst. fur Theoretische Phys. und Sternwarte, Univ. Kiel, Kiel, Germany).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.325-34 (Oct. 1983).
High-dispersion spectra of six chemically unevolved solar-type stars (special type F8-K2) and of the halo giant HD 122563 are investigated by differential model atmosphere analysis relative to the Sun to obtain abundances of barium, iron and magnesium. Effective temperatures inferred from red and infrared colours, and the iron ionization equilibrium are used to construct model atmospheres. The results are used to study the chemical evolution of the galaxy and stellar nucleosynthesis. (60 refs.)

121677 Programme of studying stellar kinematics in the main meridional section of the Galaxy. N.V.Kharchenko.
Astrometriya & Astrofiz. (USSR), no.49, p.61-6 (1983). In Russian.
The observational programme for 60 selected areas was compiled to determine the absolute proper motions of stars with respect to galaxies in the main meridional section of the Galaxy. The absolute proper motions of 5947 stars have been already measured in 21 selected areas. The results obtained from this catalogue showed that an increase in the accuracy of the stellar kinematics can be achieved by: 1) compiling an extended catalogue of the stellar proper motions with respect to a great number of galaxies; 2) setting up the astronomical standards of the proper motions free of the magnitude equation errors; 3) providing the photoelectric standards for the apparent stellar magnitudes. (8 refs.)

121678 Pulsations and viscosity. J.P.Cox, B.L.Everson (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.451-63 (Aug. 1983).
A general method for calculating the effects of viscosity and nonadiabaticity on small oscillations is presented. The method is conceptually straightforward, but complicated to apply. It is applied to spherically symmetric, purely radial motion in a spherical star; also to a 'classical' steady-state accretion disk that is isothermal in the vertical direction and that has vertical oscillations. Comparison is then made with observed dwarf novae quasi-periodic oscillations, assuming them to be disk oscillations. The observed decay time scales of these oscillations may be used to estimate the viscosity present in the accretion disk. (25 refs.)

121679 On the nature of early-type stars in the galactic halo. F.P.Keenan (Dept of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland), P.L.Dufton.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.435-45 (Oct. 1983).
Effective temperatures and surface gravities of 46 intermediate and high galactic latitude OB stars are estimated from Stromgren $|C_1|$ and Hβ photometry. In addition, helium, calcium and magnesium abundances relative to hydrogen are derived for eleven stars. The typical OB-type stellar parameters indicate that they are normal Population I stars, several of which require ejection velocities of more than 100 kms^{-1} from the plane in order to reach their present z-distances during their lifetimes. The observed correlation between peculiar velocity and mass for stars with $|z|\geq400$ pc is discussed. A plot of log N(Na I) versus $E(B-V)$ implies that the gas-to-dust ratio in the halo is probably similar to that found for material in the galactic disc. This is discussed. (73 refs.)

97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

121680 Spectra of the blue CN and CH bands for a CN-enhanced giant in the open cluster IC 4651. G.H.Smith (Mount Stromlo & Siding Spring Obs., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Astron. J. (USA), vol.88, no.9, p.1344-8 (Sept. 1983).
Spectra are presented which indicate that the giant IC 4651 23 has enhanced λ4216 CN and λ4300 CH bands relative to other giants with similar temperatures and gravities in this open cluster. Interpretation of the DDO δ CN indices and the CH band observations with the use of model atmospheres and synthetic spectra indicates that only mild ($\lesssim$0.1 dex) [C/A] or [N/A] excesses are needed in star 23 to explain the observations. (38 refs.)

121681 Early-type high-velocity stars in the solar neighborhood. III. Radial velocities, rotation indices, and line-strength indices for southern candidates. P.B.Stetson (Carnegie Inst. of Washington, Pasadena, CA, USA).
Astron. J. (USA), vol.88, no.9, p.1349-66 (Sept. 1983).
For pt.II see ibid., vol.86, no.12 (1511), p.1882-95 (1981). Radial velocities, rotation indices, and metal-line strength indices have been derived from spectra of 124 southern early-type stars possibly having large space motions, for three optical companions to high-velocity candidates, and for 28 comparison stars. The internal repeatability of these radial velocities ranges from about 1.2 km/s per observation for sharp-lined F stars to about 10 km/s for rapidly rotating A stars; the external error of the velocities is estimated to be less than 2-3 km/s. A rough calibration of the rotation indices yields (v sin i)s with an accuracy estimated at 5-7 km/s or 15%. Radial velocities accurate to ~10 km/s are obtained for an additional 19 comparison stars, six program stars, and one companion to a program star. A list is given of 45 high-velocity candidates confirmed to be main-sequence stars of spectral types earlier than ~F1, for which radial velocities are now available. When this sample is divided into high- and low-velocity subgroups on the basis of their transverse velocities, their radial-velocity distributions are also found to be different: the radial-velocity dispersion is 57 km/s for the stars with larger transverse velocities, and 21 km/s for stars with smaller transverse velocities. This evidence strongly favors the existence of main-sequence A stars with abnormally large space motions. There appear to be several binary stars in the high-velocity sample, which will be important for determining the origin of these stars. (34 refs.)

121682 T Tauri South: a protostar?. C.Bertout (Lab. d'Astrophys. Theorique, Coll. de France, Inst. d'Astrophys., Paris, France).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.L1-4 (Oct. 1983).
Study of the radio spectrum of T Tauri South, the recently discovered companion of T Tauri, suggests that it originates from the infalling envelope surrounding a protostar of 2 to 3 solar masses, and obscured by 8 to 19 magnitudes of visual extinction. (29 refs.)

121683 Dust-driven winds. I. A two-fluid model and its numerical solution. N.Berruyer, H.Frisch (Obs. de Nice, Le Mont-Gros, Nice, France).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.269-77 (Oct. 1983).
A model of dust-driven wind relevant to red giant stars is investigated, in which the usual hypothesis of 'momentum coupling' (amounting to neglect of grain particle mass) is relaxed. The flow is described by a set of two differential equations, one for the grains and one for the gas, coupled by collisional drag. The numerical solution of this two-fluid problem requires a shooting-splitting method. (41 refs.)

121684 Four-colour uvby and Hβ photometry of A5 to G0 stars brighter than 8.3^{m}. E.H.Olsen (Copenhagen Univ. Obs., Tollose, Denmark).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.55-134 (Oct. 1983).
A Stromgren uvby survey has been made of nearly all Henry Draper stars of types A5 to G0 and brighter than m_v=8.3^{m}. For nearly 2000 of the most metal-weak stars found and about 500 other stars of interest, additional uvby and Hβ photometry has been obtained. The photometric results are presented in a catalogue containing 27096 uvby and 7223 β measurements of 14816 stars. The purpose of the catalogue is to provide a complete, magnitude limited, kinematically unbiased, sample of late F type stars belonging to the intermediate population II. Combined with kinematical data this sample will be ideally suited to investigate the history of the Galaxy by studying the correlations between age, chemical composition and kinematics. (61 refs.)

121685 Spectrophotometric study of three F8 supergiants. A.A.Boyarchuk, M.E.Boyarchuk.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.68-88 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.66-85 (1981). [received: Oct. 1983]
High-dispersion spectrograms were used to investigate the three supergiants: α UMi, γ Cyg and ρ Cas. The method of curves of growth was used to determine the parameters of the atmosphere and chemical composition. The chemical composition of all three supergiants was found to be very close to the composition of the Sun. The exceptions are carbon whose abundance was found to be lower by a factor of four than in the Sun, and sodium for which an excess abundance was recorded. (12 refs.)

121686 Spectroscopic observations of HD 206267 and its possible identification with the X-ray source Cep X-4. T.S.Galkina.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.89-95 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.86-92 (1981). [received: Oct. 1983]
In order to verify the identification of the X-ray source Cep X-4 with the spectroscopic binary HD 206267, the author analyzed 35 spectrograms of the latter star, recorded in June-August, 1975. The spectra shows no apparent connection between HD 206267 and Cephus X-4. The spectroscopic features of HD 206267 suggest the presence of an extended envelope of nonuniform density around the primary component. The spectral types of the components are found to differ by not more than one spectral subclass and are estimated as O6f+O7. The mass ratio of the components is found to be 1.7. (10 refs.)

121687 A spectrophotometric study of the T Tauri star AS 353. V.I.Krasnobabtsev.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.96-108 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.93-103 (1981). [received: Oct. 1983]
Spectrograms of the star AS 353 were used to identify the recorded emission lines and to perform a comparative analysis of their equivalent widths and intensities. Fe II emission lines were used to determine the interstellar absorption (E_{B-V}=0.7-1.1^{m}). The spectral type of the star has been estimated (F0-G5). Physical conditions prevailing in the stellar envelope are discussed. Some of the Fe II and Ti II lines exhibit an anomalous enhancement which occurs simultaneously with the enhancement of the Hα and Hβ lines. (18 refs.)

121688 Polarimetric observation of white dwarfs. Yu.S.Efimov.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.124-47 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.118-39 (1981). [received: Oct. 1983]
A survey is given of linear polarization measurements performed on 85 white dwarfs and subdwarfs in U, B, V, O, R bands. The data were obtained with the 3.6-m Shain telescope at the Crimean Astrophysical Observatory in 1971-79. The intrinsic polarization of more than half of the object was greater by a factor of 2 than the root mean square uncertainty of the measurement. There are indications that the linear polarization was variable in the case of some of the objects (for example, GD 299, EG 191, Feige 110 and EG 159). (73 refs.)

121689 Is emission line strength a predictor of youth for Orion population stars?. Wm.B.Weaver (Monterey Inst. for Res. in Astron., Monterey, CA, USA).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.389-93 (Oct. 1983).
Contrary to the widespread belief that emission line strength decreases with age for Orion population stars, there is no useful correlation between observed emission line strengths and theoretically derived relative ages in these objects. (8 refs.)

121690 Photometric variability of B- and A-type supergiants. J.R.Percy, D.L.Welch (David Dunlap Obs., Univ. of Toronto, Toronto, Ontario).
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.491-505 (Aug. 1983).
Photometric observations of 16 early-type (O9 to A3) supergiants have been obtained. All but two of the stars are variable, with a range of about 0.05^{m}. The light curves are irregular, but characteristic time scales or 'quasi-periods' can be identified. The ratio of the quasi-period to the theoretical period (for pulsation in the fundamental radial mode) varies from 2-10 in the earliest-type supergiants to 0.2-2 in the later-type supergiants. The variability is most likely due to nonradial pulsation, at least in the O-B type supergiants. (24 refs.)

121691 Relativistic effects on the structure and stability of massive white dwarfs. J.M.I.Cabanell (Dept. de Mecanica y Astron., Univ. de Valencia, Valencia, Spain).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.7-17 (June 1983). In Spanish.
Obtains numerical fits for the limit mass (Newtonian), maximum gravitational mass (relativistic), and binding energy for several sequences of white dwarfs of different chemical compositions. The author calculates the value of the average adiabatic index for each model. The critical value of this index is larger than the classical value of 4/3; this implies, for example, that for carbon dwarfs the relativistic instability appears at 1.3430. This result is confirmed by the hydrodynamical calculations. (25 refs.)

97.30 VARIABLE AND PECULIAR STARS

(inc. novae)

121692 Variability of Balmer lines in magnetic Ap stars. J.Madej (Warsaw Univ. Obs., Warsaw, Poland).
Acta Astron. (Poland), vol.33, no.1, p.1-46 (1983).
The existing observational data on periodic Balmer line variations in magnetic Ap stars are analysed. Among 8 magnetic stars with variable Balmer lines, 7 exhibit the strong phase correlation between the extreme equivalent widths W_λ of the Balmer lines and either the pole-on or the equator-on position of the star. Computations have shown that the electromagnetic forces can strongly affect physical structure of an atmosphere at the magnetic equation in comparison to the undisturbed magnetic poles. The emergent Balmer lines and UV continuum radiation are significantly affected by the strong Lorentz forces, and the spectral properties of the magnetic poles and magnetic equator are differentiated. Moreover, the star becomes prolate by up to 1.5% in radius. (82 refs.)

121693 Search for β Cephei stars south of declination −20°. II. Photometric and spectrographic observations of early B giants and subgiants—winter objects. C.Sterken (Astrophys. Inst., Vrije Univ., Brussel, Belgium), M.Jerzykiewicz.
Acta Astron. (Poland), vol.33, no.1, p.89-111 (1983).
For pt.I see ibid., vol.27, no.4, p.365-87 (1977). Results of the second part of a program begun in 1975 (Jerzykiewicz and Sterken 1977) are presented. Out of 39 β Cephei candidates observed photometrically, 7 turned out to vary with b ranges exceeding 0.020^m, while 21 have been found constant to within 0.010^m or better. From spectrographic observations one of the candidates, HD 129557=HR 5488 (B2 III), is found to be a β Cephei variable with a period of 0.135^d and the $2K$ amplitude of 18.4 km/s. A comparison of the results with other photometric searches for β Cephei variables shows good agreement in most cases. It is concluded that in the low temperature extension of the β Cephei region on-and-off type pulsations occur. (22 refs.)

121694 The analysis of the RR Lyrae type variable HD 176387 (MT **Tel).** A.Przybylski (Mount Stromlo & Siding Spring Obs. Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Acta Astron. (Poland), vol.33, no.1, p.141-8 (1983).
In a coarse analysis the RR Lyrae type variable HD 176387 (MT Tel) was compared with the Hyades star HD 26462 and the old disc population star γ Vir S. It was found that HD 176387 is deficient in metals by a factor of 270 in comparison with HD 26462 and by a factor of 90 in comparison with γ Vir S. (12 refs.)

121695 Far UV radiation in cataclysmic variables. W.Wargau, H.Drechsel, J.Rahe (Dr.-Remeis-Sternwarte Bamberg, Astron. Inst. Univ. Erlangen, Erlangen, Germany).
Acta Astron. (Poland), vol.33, no.1, p.149-58 (1983).
The absolute continuum flux distributions in the far UV region of nine cataclysmic systems exhibit considerable excess radiation over the fluxes expected from steady-state optically thick accretion disk models. The UV continua can alternatively be interpreted as superposition of two blackbody sources: a hot ($0.5\text{-}2\times10^5$K) component originating from the boundary layer, and a cooler ($1\text{-}2\times10^4$K) component which is radiated by the accretion disk and/or the bright spot. (29 refs.)

121696 A Be type variation in an O star. L.Divan (Inst. d'Astrophys. de Paris, Paris, France).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.L8-10 (Oct. 1983).
BCD observations of the Oe star HD 60848 show that the parameters of the continuum are variable and that the variation of the V magnitude and of the colours as a function of D is the same as for Be stars. This result is a new indication that the Be phenomenon can occur in O stars as early as O7.5 or O8. Simultaneous observations of Hα, Paschen lines and Balmer discontinuity show that the amount of emission in the hydrogen lines varies in the same direction as the amount of emission in the Balmer continuum. (26 refs.)

121697 Phenomenological models of antiflare stars. A.F.Pugach.
Astrometriya & Astrofiz. (USSR), no.49, p.55-60 (1983). In Russian.
Four phenomenological models of antiflare stars are discussed. None of them satisfies all the observational data available, but the so-called eruptive model is the more plausible one. More observations are needed. A list of the most important observational tasks for the antiflare stars problem is given. (30 refs.)

121698 Scanner observations of the classical Cepheids RT Aur and T Vul. B.S.Rautela, S.C.Joshi (Uttar Pradesh State Obs., Naini Tal, India).
J. Astrophys. & Astron. (India), vol.4, no.1, p.1-9 (March 1983). [received: Oct. 1983]
The effective temperatures of the classical Cepheids RT Aur and T Vul have been determined by a comparison of their spectral scans with appropriate model atmospheres. The radii of the stars have been determined through the Wesselink method. Using these temperatures and the Wesselink radii, the luminosities of the stars have been determined. These radii estimates, including the radii of SU Cas and ζ Gem fit better in the theoretical period-radius relationships given by Cogan (1978), as compared to earlier determinations of Wesselink radii. The pulsation masses and evolutionary masses of the stars have been calculated. (30 refs.)

121699 Three-colour electrophotometry of DY PEG. A.N.Tomov, N.A.Tomov (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.709-12 (1983).
Presents photometric observations of DY Peg. The light curve is discussed for this Cepheid. (6 refs.)

121700 Nova Normae 1983. R.Peterson.
I.A.U. Circ. (USA), no.3871, 1 pp. (30 Sept. 1983).
It is reported that echelle spectrograms obtained on 1983 September 24 show that this object (see IAUC 3869) is indeed a nova. Balmer emission lines (Hα, Hβ, and Hγ), together with several additional features, are superimposed on a faint continuum. Interstellar Na I D and Ca II lines were also observed. (1 ref.)

121701 Nova Normae 1983. J.Hers.
I.A.U. Circ. (USA), no.3874, 1 pp. (4 Oct. 1983).
Reports visual magnitude estimates for the period 1983 September 26 to October 1. (no refs.)

121702 VY Sculptoris. M.S.Cropper, B.Warner.
I.A.U. Circ. (USA), no.3877, 1 pp. (7 Oct. 1983).
It is reported that in early October 1983 the novalike variable VY Sculptoris was at about magnitude 18.5; this is the first recorded low state for this star. (1 ref.)

121703 Frequency analysis of β Cephei variables in NGC 6231. L.A.Balona (South African Astron. Obs., Cape, S Africa), R.R.Shobbrook.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.309-20 (Oct. 1983).
Photometric observations are presented for four recently discovered β Cephei variables in the very young open cluster NGC 6231. Fourier analyses of about 500 observations of each star were performed to determine the oscillation frequency spectra. Comparison with variables in NGC 3293 shows that the β Cep stars in NGC 6231 are only slightly evolved from the ZAMS, indicating that the instability strip is at least one magnitude wide. Though the periods of the β Cep stars in NGC 6231 are much shorter than those in NGC 3293, the pulsation constants are about the same. The consequences of these findings for the excitation mechanism are discussed. (26 refs.)

121704 On the evolution of accretion disc flow in cataclysmic variables. I. The prospect of a limit cycle in dwarf nova systems. J.Faulkner, D.N.C.Lin (Lick Obs., Univ. of California, Santa Cruz, CA, USA), J.Papaloizou.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.359-75 (Oct. 1983).
Presents the basic physics of a mechanism which explains dwarf nova outburts as accretion disc instabilities. Briefly put, the strong and oppositely directed temperature dependences of opacity in hydrogen ionization regions drive a thermal instability which modulates mass transfer throughout the disc. The authors also show that the conventional thin disc treatment breaks down in cool regions, where the surface boundary condition dominates the structure. One major purpose of the paper is to modify the conventional treatment, to produce analytical approximations for many of the relationships of interest. When the results are applied to a schematic local treatment of disc flows, the prospect of a thermal limit cycle is revealed. (34 refs.)

121705 Enhanced polarization in the Ca II K line of the Be star κ Dra. D.Clarke, A.Brooks (Dept. of Astron., Univ. Obs., Glasgow, Scotland).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.9p-13p (Oct. 1983).
Spectropolarimetric observations of κ Dra reveal an enhancement of the linear polarization at the centre of the Ca II K line in relation to the nearby continuum, this being the first report of such an effect in a Be star other than for the Balmer lines. In keeping with previous observations, no polarizational change was detected across Hβ for this star. (15 refs.)

121706 A nebula around Nova BT Monocerotis. T.R.Marsh, R.A.Wade (Inst. of Astron., Cambridge, England), J.B.Oke.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.33p-7p (Oct. 1983).
Reports the spectroscopic discovery of nebular Hα emission around Nova BT Monocerotis. The indicated expansion distance to this system is about 1800 pc. (8 refs.)

121707 On the Cepheid luminosity zero-point from cluster Cepheids. J.A.R.Caldwell (South African Astron. Obs., Pretoria, S Africa).
Observatory (GB), vol.103, no.1056, p.244-8 (Oct. 1983).
Van den Bergh (1977), de Vaucouleurs (1978), and Martin, Warren and Feast (1979) have discussed the zero-point calibration of the period-luminosity (P-L) and period-luminosity-colour (P-L-C) relationships from cluster Cepheids. The zero-points are reevaluated by the author with new data and a slightly improved method, in connexion with new work on SMC and galactic Cepheids. The results are compared with the P-L relationship of Fernie and McGonegal (1983) and with the zero-points implied by independent methods. (30 refs.)

121708 The infrared spectrum of the peculiar star HDE 316285. P.A.Whitelock (South African Astron. Obs., Pretoria, S Africa).
Observatory (GB), vol.103, no.1056, p.255-7 (Oct. 1983).
The P-Cygni star HDE 316285 is probably a heavily reddened single star undergoing mass-loss, rather than a symbiotic system as suggested by some authors. The infrared continuum is from the Rayleigh-Jeans tail of a high-temperature source plus emission from a hot plasma. The 1.2-4.1-μm spectrum shows strong emission lines, mainly of H I and He I. (11 refs.)

121709 The spectrum of Nova Sagittarii 1982 in the transition phase. T.Iijima, L.Rosino (Astrophys. Obs., Asiago, Italy).
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.506-8 (Aug. 1983).
Spectra of Nova Sgr 1982 have been obtained at the end of October, nearly one month after its discovery, with the one-prism spectrography equipped with a Carnegie-RCA S-20 image tube (dispersion 60 Å mm^{-y}1 at Hγ) at the Cassegrain focus of the 122-cm telescope. The spectra are characterized by wide emission lines of H, O I, N II and Fe II. They indicate that the nova was in its late transition phase. Identifications are given for the lines recorded from $\lambda\lambda$4100 to 8500. (3 refs.)

121710 A multiwavelength study of the short-period cataclysmic variable V442 Ophiuchi. P.Szkody (Dept. of Astron., Univ. of Washington, Seattle, WA, USA), A.W.Shafter.
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.509-19 (Aug. 1983).
A detailed study of this cataclysmic variable from ultraviolet to infrared wavelengths has been accomplished. An orbital period of 202 minutes is evident from radial-velocity variations in Hα and He II λ4686. There is very active flickering in the optical light curves but no variation at the orbital period, implying a low inclination. The ultraviolet spectrum shows little line emission and less continuum variation than the optical. The infrared fluxes imply a hot, optically thick disk. The total flux distribution over all observed wavelengths is consistent with a disk with a mass accretion rate of 10^{-8} $\mathfrak{M}_\odot$

yr^{-1}. In terms of period, mass accretion rate, and He II λ4686 strength, V442 Oph is most similar to systems of the H 2252-035 type. (31 refs.)

121711 Spectral classification of select delta Scuti stars. III. R.Ortega, R.Peniche, J.H.Pena (Inst. de Astron., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), M.A.Hobart.
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.45-9 (June 1983).
For pt.II see Publ. Astron. Soc. Pac., vol.93, no.556, p.735-40 (1981). A spectral classification of selected delta Scuti stars has been carried out. Some of the classified stars have been recently discovered and in about half of the considered stars no previous spectral classification was reported. The absolute magnitude and $(b-y)$ color are derived from the spectral type found for each star and these values fixed their location in both the H-R diagram and the period-luminosity-color relation. 97.60 LATE STAGES OF STELLAR EVOLUTION

(inc. black holes)

97.60B Supernovae

121712 Supernovae. P.M.Williams, E.P.Aksenov.
I.A.U. Circ. (USA), no.3873, 1 pp. (4 Oct. 1983).
It is reported that a supernova has been discovered at $\alpha=3^h14^m57.0^5$, $\delta=+41^\circ\ 40'33''$ (equinox 1950.0), within 2″ to 3″ of the nucleus of NGC 1265. On 1983 October 1 the object was at $m_v\sim13$. A second supernova has been discovered 7″ east and 5″ south of the galaxy MCG 6-36-55 ($\alpha=16^h35.1^m$, $\delta=+36^\circ31''$, equinox 1950.0), in Hercules. This supernova was at $m_{pg}\sim16'$ on 1983 September 10. (no refs.)

121713 Supernova in IOC 1731. P.Wild.
I.A.U. Circ. (USA), no.3875, 1 pp. (5 Oct. 1983).
Reports the discovery on 1983 October 1 of a supernova at $\alpha=01^h47^m23.74^s$, $\delta=+26^\circ57'03.9''$ (equinox 1950.0), 9″ east and 10″ north of the nucleus of IC 1731. At the time of discovery the supernova was at $m_{pg}=14$. (no refs.)

121714 Supernovae. R.Evans, T.Cragg, G.Thompson.
I.A.U. Circ. (USA), no.3877, 1 pp. (7 Oct. 1983).
Reports the visual detection on 1983 October 6 of a supernova of magnitude 14.5 in NGC 1448 ($\alpha=03^h42.9^m$, $\delta=-44^\circ48'$, equinox 1950.0), in Horologium. The supernova is 30″ east and 5″ north (or possibly south) of the nucleus of the galaxy. It is also reported that the supernova in NGC 1265 reported in IAUC 3873 is in fact the same foreground star reported in January 1983 (see IAU Circ. 3769, 3770). (3 refs.)

97.60G Pulsars

121715 Role of mangetic fields during the stellar collapse and origin of binary pulsars. F.Pacini (Arcetri Astrophys. Obs., Univ. of Florence, Florence, Italy).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.L11-12 (Oct. 1983).
Suggests that pulsars originate with a stellar collapse whose time scale is determined by the electromagnetic removal of angular momentum. This may explain why binary pulsars generally have weak magnetic fields and leads to the expectation of a large number of binaries among very fast, weakly magnetized neutron stars. (7 refs.)

121716 Genesis stories for the millisecond pulsar. M.A.Ruderman, J.Shaham (Dept. of Phys., Columbia Univ., New York, NY, USA).
Comments Astrophys. Comments Mod. Phys. Part C (GB), vol.10, no.1, p.15-22 (1983).
There exists a family of exceptionally high spin low magnetic field pulsars whose origin is problematic. Most spectacular and extreme is the 'millisecond pulsar' PSR 1937+214. There are now a variety of proposed geneses for its birth. These fall into several classes. (1) PSR 1937+214 was created in a single isolated explosion which left behind a neutron star spinning near its instability limit. (2) The millisecond pulsar was initially a more slowly spinning neutron star—probably a dead pulsar—in a tight binary. Accretion from its companion spun it up to a fast active pulsar. (3) The pulsar was originally a white dwarf accreting from a binary companion. When its Chandrasekhar limit was exceeded the spinning dwarf collapsed and there was a passover to a neutron star whose amplified spin reached the maximum possible one. (4) The millisecond pulsar came from two old neutron stars bound into a tight binary who ultimately fused into a single neutron star revolving as a superfast low field reborn pulsar. The advantages and disadvantages of each model are discussed. (16 refs.)

121717 The 1.5 millisecond pulsar. D.C.Backer (Radio Astron. Lab., Univ. of California, Berkeley, CA, USA).
Comments Astrophys. Comments Mod. Phys. Part C (GB), vol.10, no.1, p.23-6 (1983).
The discovery of the 1.5 millisecond pulsar is discussed. The emission and rotational energy is considered, in conjunction with evolutionary models. (5 refs.)

121718 Expected high-frequency radiation from the 1.5-ms pulsar. V.V.Usov (Space Res. Inst., Acad. of Sci., Moscow, USSR).
Nature (GB), vol.305, no.5933, p.409-10 (29 Sept. 1983).
The 1.5-ms pulsar PSR 1937+214 has so far been observed only in the radio range, and X-ray and γ-ray observations at energies of between ~30 and 1000 MeV have yielded only upper limits for the radiation flux. An optical identification of the 1.5-ms pulsar has been proposed, but this identification cannot yet be considered definite. Thus it is of great interest to determine in which spectral region PSR 1937+214 shows a radiation maximum. The author considers how the current pulsar theory answers this question, and shows that the 1.5-ms pulsar should be an intense source of γ quanta with an energy of $\sim10^{11}$ eV below which γ rays freely leave its magnetosphere. The flux of superhard γ quanta emitted by this pulsar may exceed, by an order of magnitude, the flux from the pulsar in the Crab Nebula. (14 refs.)

121719 The melodious pulsar.
Sky & Telesc. (USA), vol.66, no.4, p.311-13 (Oct. 1983).
Discusses the discovery of the millisecond pulsar. The observations, possible evolution and various models are discussed. (no refs.)

97.80 BINARY AND MULTIPLE STARS

(inc. extrasolar planetary systems)

121720 Computer simulations of gravitational encounters between pairs of binary star systems. J.B.Hoffer (Dept. of Phys. & Astron., Michigan State Univ., MI, USA).
Astron. J. (USA), vol.88, no.9, p.1420-34 (Sept. 1983).
Encounters (collisions) between pairs of binary stars were computer simulated. The 41564 gravitational collisions were divided into five mass families and all binaries initially had circular orbits. The exchanged energy cross section for collisions between two binaries composed of identical mass stars as found to be roughly 2-3 times that for a single star colliding with a binary having components with masses equal to that of the single star. Other results cannot be stated so easily, but the energy released by hard (low-energy) binary collisions appears to be significant. A surprising result is that roughly 40% of the head-on binary-binary collisions in a globular cluster core (where most of the collisions are hard ones) precipitate a physical collision between two stars, possibly leading to their coalescence. (14 refs.)

121721 Photomeric elements of the eclipsing binary HP Aur. G.Giuricin, F.Mardirossian, M.Mezzetti (Osservatorio Astron. di Trieste, Trieste, Italy).
Acta Astron. (Poland), vol.33, no.1, p.159-62 (1983).
Using Wood's (1972) model the authors have analyzed Meinunger's (1980) V and V photoelectric light curves of the eclipsing binary HP Aur. Photometric elements have been obtained. The G0 primary turns out to be larger than its cooler and fainter companion, which appears to be a late G-type dwarf. Estimates of the fundamental elements of HP Aur, based on plausible assumptions about its masses, reveal that this binary is a normal main sequence detached system; both components appear to follow fairly well the empirical mass-luminosity and mass-radius relations typical of main sequence stars. (10 refs.)

121722 On the classification of the eclipsing system V548 Cygni, a sd-d candidate. G.Russo, L.Milano (Capodimonte Astron. Obs., Naples, Italy).
Acta Astron. (Poland), vol.33, no.1, p.163-70 (1983).
Using the Wilson-Devinney approach, the authors have obtained a new solution of Ertan's (1981) photoelectric observations of V548 Cygni, an eclipsing binary suspected to be a sd-d candidate. The solution gives a secondary component in contact with its lobe; the computation of the absolute elements, based on the photometric mass ratio and on the spectroscopically determined mass function $f(m)=0.0544\ M_\odot$, gives a configuration typical of mass exchanging Algols. The usefulness of Roche-model-based methods for such doubtful systems is emphasized. (20 refs.)

121723 Mg II profile variations of Zeta Aurigae. I.A.Ahmad (Imad-ad-Dean Inc., Bethesda, MD, USA), R.D.Chapman, Y.Kondo.
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.L5-7 (Oct. 1983).
Observes variations in the Mg II 2800 A doublet of zeta Aurigae. The Mg II profiles deviate from simple P-Cygni profiles in that they exhibit an absorption feature consistent with Chapman's (1981) interpretation of C IV absorption as evidence of a column of accretion onto the B star component of the binary. The authors find the opening angle of the shock cone containing the accretion column to exceed 16° implying a stellar wind velocity of approximately 67 km s^{-1}, unless the H II region temperature is unusually high. The turbulence velocity of the wind then appears to be about 33 km s^{-1}. (11 refs.)

121724 A study of ultraviolet spectra of ζ Aur/VV Cep systems. II. Mass loss of supergiants in ζ Aur, 32 Cyg and 31 Cyg. A.Che, K.Hempe, D.Reimers (Hamburger Sternwarte, Univ. Hamburg, Hamburg, Germany).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.225-39 (Oct. 1983).
For pt.I see ibid., vol.115, no.1, p.133-7 (1982). Describes a method for the determination of mass loss rates or red giants in spectroscopic eclipsing binaries. A non-spherical, three-dimensional line transfer code is applied to investigate the wind and mass loss of the K supergiants in ζ Aur, 32 Cyg and 31 Cyg. The authors compare theoretical line profiles with IUE observations of Fe II, Si II and S II resonance lines at various binary phases. In a first approximation no detectable asymmetry in the K giant wind envelope was observed. There is some uncertainty in the mass loss rate for 31 Cyg due to the extended H II region aground the hot B star. (39 refs.)

121725 *UBV* photometry of the optical candidate for LMC X-3. M.van der Klis, S.Tjemkes, J.van Paradijs (Astron. Inst. 'Anton Pannekoek', Univ. of Amsterdam, Amsterdam, Netherlands).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.265-8 (Oct. 1983).
Results are reported of two weeks of optical photometry of the optical counterpart of LMC X-3 obtained in December 1981 When folded modulo the 1.7 d period recently proposed for this system on the basis of radial velocity measurements, the data show a brightness minimum near the inferior conjunction of the X-ray source. Combining the data with photometry obtained in 1974, the authors find long-term brightness variations over a range of up to 0.5 mag. Removing these, the authors find a double-wave orbital light curve with an amplitude of ~0.2 mag. The authors determine a mean period for the interval 1974-81 and show that the observed light curve may be dominated by ellipsoidal variations, and that an additional light source, presumably an accretion disk, is likely to be present in the system. (20 refs.)

121726 Micrometer measurements of visual binaries. P.J.Morel (Nice Obs., Nice, France).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.39-46 (Oct. 1983).
Presents 376 micrometer measurements of 116 visual binaries made at the Nice Observatory in 1980-3. (3 refs.)

121727 Four-colour photometry of eclipsing binaries. XVI. Light curves of VV Pyxidis. J.V.Clausen, B.Nordstrom (Copenhagen Univ. Obs., Tollose, Denmark).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.149-59 (Oct. 1983).
For pt.XV B see ibid., vol.52, no.2, p.323-31 (1983). *uvby* light curves of the detached early A-type eclipsing binary VV pyxidis are presented. A detailed analysis based on the light curves and on new radial velocity curves is published separately. (2 refs.)

121728 Four-colour photometry of eclipsing binaries. XVII. Light curves of DM Virginis. J.Andersen, J.V.Clausen, B.Nordstrom (Copenhagen Univ. Obs., Tollose, Denmark).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.161-6 (Oct. 1983).
For pt. XVI see ibid., vol.54, no.1, p.149-59 (1983). *uvby* light curves (687 points in each colour) of the well-detached F-type eclipsing binary DM Vir are presented. A detailed analysis based on these light curves and the double-lined spectroscopic orbits by Popper (1971) is published separately. (2 refs.)

121729 Contribution to the study of F, G, K, M binaries. II. Orbital elements of the single-lined spectroscopic binaries HD 69148 and HD 85091. J.M.Carquillat, R.Nadal, N.Ginestet, A.Pedoussaut (Obs. du Pic-du-Midi et de Toulouse, Toulouse, France).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.187-90 (Oct. 1983). In French.
The spectroscopic binaries HD 69148 and HD 85091 were observed at the Observatoire de Haute-Provence in order to determine their spectrographic orbits. The orbital elements are tabulated. Estimations of the spectral types of the secondaries and of the semi-major axis, deduced from the values of $f(m)$ and a sin i, and of the spectral types of the primaries (G8 III and dGF0 respectively), indicate that both systems are detached. (9 refs.)

121730 A uvby, β photometric survey of southern hemisphere eclipsing binary stars. G.W.Wolf, J.T.Kern (Dept. of Phys. & Astron., Southwest Missouri State Univ., Springfield, MO, USA).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.429-41 (Aug. 1983).
A uvby, β photometric study of southern hemisphere eclipsing binary stars has been undertaken at Cerro Tololo Inter-American Observatory. The standardized colors and V magnitudes for 288 binaries at quadrature and/or at minimum are presented, along with an indication of the accuracy of the standardisation and photometry. Discussions of the resolving time of the pulse-counting photometers and of the atmospheric extinction at CTIO are included. (9 refs.)

121731 Reflection effect in close binaries. II. Distribution of emergent radiation from the irradiated component along the line of sight. A.Peraiah (Indian Inst. of Astrophys., Bangalore, India).
J. Astrophys. & Astron. (India), vol.4, no.1, p.11-17 (March 1983). [received: Oct. 1983]
For pt.I see ibid., vol.3, no.4, p.485 (1982). Calculates the effects of irradiation from a point source observed at infinity. Plane-parallel approximation and spherically-symmetric approximations are employed in calculating the self-radiation field for the sake of comparison. It is found that there are considerable changes in the radiation received at infinity between the approximation of plane-parallel stratification and spherical symmetry. (3 refs.)

121732 Spectroscopic binaries near the North Galactic Pole. VII. HD 107742. R.F.Griffin (Obs., Univ. of Cambridge, Cambridge, England).
J. Astrophys. & Astron. (India), vol.4, no.1, p.19-21 (March 1983). [received: Oct. 1983]
Photoelectric radial-velocity measurements show that HD 107742 is a spectroscopic binary with a period of 875 days and a small (but definitely nonzero) eccentricity. The star is not a member of the Coma Cluster, against which it is seen projected. (6 refs.)

121733 Spectroscopic binaries near the North Galactic Pole. VIII. HD 121844. R.F.Griffin (Obs., Univ. of Cambridge, Cambridge, England).
J. Astrophys. & Astron. (India), vol.4, no.1, p.23-6 (March 1983). [received: Oct. 1983]
For pt.VII see ibid., vol.4, no.1, p.19-21 (1983). Photoelectric radial-velocity measurements show that HD 121844 is a spectroscopic binary with a period of 303 days, a high eccentricity (0.49) and a high negative γ-velocity (-61 km s^{-1}). (5 refs.)

121734 Ultraviolet variability of HD 62001—the central star of the missing nebula V-V 1-7. N.Kameswara Rao (Indian Inst. of Astrophys., Bangalore, India), D.P.Gilra.
J. Astrophys. & Astron. (India), vol.4, no.1, p.59-63 (March 1983). [received: Oct. 1983]
IUE observations of HD 62001 do not confirm the UV variability of 0.15 mag seen from the ANS observations. These intriguing variations in ANS observations seem to be caused by a nearby (~70 arcsec away) B star getting in and out of the field of view of the telescope, which had a jitter of 20 arcsec. There seems to be no evidence for the presence of a hot companion, either from the energy distribution or from UV variability. However, visual light variations are present. This, coupled with the radial velocity variations, indicates a binary nature probably of Algol type. (10 refs.)

121735 Absolute spectrophotometry of υ Sgr. V.I.Burnashev.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.109-23 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.104-17 (1981). [received: Oct. 1983]
Data obtained by absolute spectrophotometry and narrow-band photometry of the close binary υ Sgr are discussed. The data were obtained in 1973-78 in the spectral range 3200-7350 Å. The observed energy distribution in the spectrum has been compared with the Klinglesmith (1971) and Nariai (1963) model calculations. The estimated interstellar absorption is $A_V=0.75\text{-}1._2{}^m$. The spectral type of the invisible companion is estimated as O9 V. Irregular variations in light and color, amounting to a few percent, were recorded on a number of days. The overall level of Hα emission was found to remain approximately constant throughout the orbital period. (23 refs.)

121736 10^{12} eV radiation from the X-ray source Cyg X-3 observed at Tien Shan in 1977 and 1978. Dzh.B.Mukanov.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.161-5 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.151-6 (1981). [received: Oct. 1983]
A description is given of the system used at the Tien Shan station to record Cerenkov pulses due to extensive atmospheric showers. Observations of the X-ray source Cyg X-3, made during 1977-78, are presented. They show that the gamma-ray flux from this object has a periodic component. In 1977, the flux in the phase range 0.130-0.185 of the 4.8-hr component was (4.0 ± 1.0)% of the cosmic-ray background. In 1978, the flux corrected for the Doppler effect in the phase range 0.157-0.212 was (4.29 ± 2.72)% of the cosmic-ray background and the corresponding figure for the phase interval 0.768-0.823 was (3.6 ± 1.81)%. (11 refs.)

121737 A possible variation in the 4.8-hr period of Cyg X-3. Yu.I.Neshpor, Lu.L.Zyskin.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.166-9 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.157-60 (1981). [received: Oct. 1983]
An analysis is presented of measurements of the flux of gamma rays with energy $E\geq2\times10^{12}$ eV from Cyg X-3 for 1972-78. The measurements were made at the Crimean Astrophysical Observatory. It is shown that the period of ~4.8 hr appears to vary with time at a rate in the range -0.3×10^{-9} $s.s^{-1}<\dot{P}<2.5\times10^{-9}$ $s.s^{-1}$. (5 refs.)

121738 GX 1+4. R.Hall, J.Davelaar.
I.A.U. Circ. (USA), no.3872, 1 pp. (30 Sept. 1983).
It is reported that an observation by EXOSAT on 1983 September 24 to 25 failed to detect the X-ray pulsator GX 1+4; the upper limit to the observed flux was about 4 ufu. The occurrence of this low X-ray state indicates that large changes have occurred in the mass transfer from the M6 III star to the neutron/star companion. The optical counterpart has V=18.9, J=10.4 and shows symbiotic characteristics with very high ionisation lines (Fe X); its position is $\alpha=17^h28^m57.89^s$, $\delta=-24°42'34.9''$ (equinox 1950.0). (1 ref.)

121739 Optical and X-ray observations of 2S 0921−630. G.Branduardi-Raymont, R.H.D.Corbet, K.O.Mason, A.N.Parmar (Mullard Space Sci. Lab., Dorking, England), P.G.Murdin, N.E.White.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.403-16 (Oct. 1983).
Reports photometric and spectroscopic measurements of 2S 0921−630 covering the years 1975-82. The radial velocity data confirm the 9-day period previously suggested for the system and exclude alternative periods of 17.9 and 7.7 days. The ephemeris for the time of maximum radial velocity of the base of the He II 4686 Å line is JD $2444293.1\pm0.6+N\times8.990\pm0.015$ dyas. There is no well-defined or stable eclipse of the B-band light. However, dips of up to one magnitude and lasting less than a tenth of a cycle are seen preferentially in the phase region 0.0 to 0.3. The authors also present the first X-ray spectrum of 2S 09214−630. The best fit parameters for a thermal bremsstrahlung model are $kT=13.4\pm0.5$ keV with an absorbing column density of $(5.7\pm1.0)\times10^{21}$ H atoms cm^{-2}. (13 refs.)

121740 The AM Herculis-type binary E 1405−451. J.Bailey (Anglo-Australian Obs., Epping, Australia), D.J.Axon, J.H.Hough, D.J.Watts, A.B.Giles, J.G.Greenhill.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.1p-7p (Oct. 1983).
Reports photometry and polarimetry of the AM Her-type binary E 1405−451. For the first time circular polarization has been detected in such an object at wavelengths longer than 1 μm. The light curves and polarization curves at J and H show a minimum centred on the optical minimum but very much narrower. At H significant polarization is only observed for a short period on either side of the minimum. The observations are in good agreement with the predictions of cyclotron models. The form of the polarization curve indicates that the accretion column is always in the hemisphere of the white dwarf towards us, and that the field becomes almost parallel to the line-of-sight at the phase of the minimum. (11 refs.)

121741 A failed search for black dwarfs as companions to nearby states. R.F.Jameson, M.R.sherrington (Astron. Dept., Univ. of Leicester, Leicester, England), A.B.Giles.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.39p-41p (Oct. 1983).
Reports a search for black dwarfs (objects of mass $0.08-0.001$ $M_\odot$) as companions to nearby stars. Areas around 21 nearby stars were scanned but no black dwarfs were found. (3 refs.)

121742 Spectroscopic binary orbits from photoelectric radial velocities. LII. HD 57339. R.F.Griffin (Cambridge Obs., Cambridge, England).
Observatory (GB), vol.103, no.1056, p.252-4 (Oct. 1983).
HD 57339 is an eighth-magnitude star in the southeastern part of Gemini. It has been measured in 17 consecutive years, and rather more than two cycles of its orbit have been witnessed. The total number of observations is 55. An orbital solution is presented. (8 refs.)

97.90 OTHER TOPICS IN STELLAR ASTRONOMY

121743 A model of a neutrino stellar system and the upper bound of neutrino mass obtained from the rotation curves of some galaxies. Ching Cheng-rui, Ho Tso-hsiu, Zhang Yuan-zhong (Inst. of Theoretical Phys., Acad. Sinica, Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1145-51 (1983).
The authors discuss a stellar model of degenerate massive neutrinos with a core made of heavy matter. The dimensions of the core much smaller than the scale of a neutrino star. The Oppenheimer-Volkoff equation is solved for such a system. The calculation shows that under certain conditions, this neutrino halo will resemble a pure neutrino star. They have obtained inside the neutrino star (or halo) the rotation curve and the gravitational red shifts. It is interesting to note that the relative rotation velocity v(r) depends only on the relative coordinate $\xi\equiv r/R$ in the nonrelativistic cases. Therefore, all nonrelativistically degenerate neutrino systems will have a universal relative rotation curve. Within the accuracy of numerical calculation, the authors have also obtained a relation connecting the maximum velocity V_m and the corresponding coordinate R_m as $V_mR_m{}^2=0.231$. By comparing this relation with the observed rotation data at large distances for some galaxies, they have obtained an upper bound for neutrino mass of about 6-9 eV. (16 refs.)

98.20 STELLAR CLUSTERS AND ASSOCIATIONS

121744 The main sequence of the globular cluster M22. G.Alcaino, W.Liller (Inst. Isaac Newton, Ministerio de Educacion de Chile, Santiago, Chile).
Astron. J. (USA), vol.88, no.9, p.1330-43 (Sept. 1983).
The authors present photographic photometry for 545 stars in the conspicuous metal-poor globular cluster M22 (NGC 6656). The Pickering-Racine wedge was used with the CTIO 1-m Yale telescope and the ESO 3.6-m telescope to extend the photoelectric limit from $V\sim16.2$ to $V\sim18.9$. For the main-sequence turnoff, they have determined its position to lie at $V=17.5\pm0.2$ (m.e.) and $B\text{-}V=0.66\pm0.03$ (m.e.). From these values, the authors calculate the intrinsic values $M_V=4.00$ and $(B-V)_0=0.34$. For the cluster as a whole, they derive a distance modulus $(m\text{-}M)_V=13.50\pm0.15$ and reddening $E(B\text{-}V)=0.32\pm0.03$. Using the models of Iben and Rood (1970) and the isochrones of Ciardullo and Demarque (1977) and VandenBerg (1983), the authors deduce an age of 14.5 ± 4 Gys. The uncertainty in the age, larger than normal, arises from the difficulty of evaluating the reddening to the cluster and to the spread in (or uncertainty of) the value of [Fe/H]. (61 refs.)

121745 Colour magnitude diagram for central stars of globular cluster M15. N.M.Spassova (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.705-7 (1983).
BV photometry of all stars brighter than $V=14.90$ and located in a region of $12''\leq R\leq0.5'$ around the cluster centre is derived. In the cluster's investigated area, 143 cluster members, 4 probable members, 6 field and 54 stars without known proper motions are measured. A colour magnitude diagram for the central stars of M15 is presented and discussed. (9 refs.)

121746 Globular clusters and galaxy formation. S.Van Den Bergh (Dominion Astrophys. Obs., Herzberg Inst. of Astrophys., Victoria, British Columbia, Canada).
Comments Astrophys. Comments Mod. Phys. Part C (GB), vol.10, no.1, p.27-31 (1983).
Real differences exist between the specific globular cluster frequencies S observed in different galaxies. In E and SO galaxies these frequencies are found to be an order of magnitude higher than they are in spirals. Among elliptical galaxies and lenticulars there is no correlation between S and luminosity, but some indication of a dependence on cluster environment. Central galaxies in rich clusters appear to be particularly rich in globulars. Possible implications of this result for theories of galaxy and cluster formation are discussed. (18 refs.)

121747 Main-sequence binaries, contact binaries, and blue stragglers in globular clusters. J.H.Krolik (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Nature (GB), vol.305, no.5934, p.506-8 (6 Oct. 1983).
Tidal capture should be effective in creating close binaries comprising two-main-sequence stars. Subsequent evolution of such binaries is very likely to lead to mass exchange between the two, and possible merger. In conventional calculations, gravitational radiation drives the binary orbital evolution; recently, it has been shown that in the denser globular clusters, where tidal capture is most effective, gravitational encounters with passing field stars also have an important role, both by slow, cumulative compression of the binary orbit, and by occasional catastrophic physical collisions. On the basis of these mechanisms, the present author predicts that globular clusters should contain substantial numbers of: close binaries; low-mass contact binaries; and 'blue stragglers', stars lying on the extrapolated main sequence beyond the turn-off. These objects should be most common in the densest regions of the Galaxy's globular cluster system. (35 refs.)

121748 Integrated magnitudes and colors of clusters in the Magellanic Clouds and Fornax system. K.C.Gordon, G.E.Kron (Pinecrest Obs., Flagstaff, AZ, USA).
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.461-73 (Aug. 1983).
Integrated magnitudes and colors and multiaperture observations are presented for 38 SMC clusters, NGC 1841. 16 LMC clusters, and four in the Fornax system. The data from *PV*, six-color, and four-color observations are reduced to the *BV* system. Total magnitudes and brightness distributions are computed for 33 clusters by fitting all available measures to V to King's theoretical profiles. (47 refs.)

121749 Notes on the open cluster NGC 1252 with the variable carbon star TW Horologh as a probable member. R.Bouchet (European Southern Obs., Santiago, Chile), P.S.The.
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.474-9 (Aug. 1983).
UBV photometry indicates 14 probable members of the open cluster NGC 1252. It is a cluster of age $\sim0.5\times10^9$ yr, located at a distance of ~470 pc. The N-type semiregular variable TW Hor (=HD 20234) is most probably a member of NGC 1252. From its $M_{\text{bol}}=-5.21^{\text{m}}$ and its space velocity it is argued that this variable carbon star belongs to the young disk population. (19 refs.)

98.40 INTERSTELLAR MATTER; AND NEBULAE

121750 Size distributions of H II regions in galaxies. I. Irregular galaxies. P.W.Hodge (Astron. Dept., Univ. of Washington, Seattle, WA, USA).
Astron. J. (USA), vol.88, no.9, p.1323-9 (Sept. 1983).
The size distributions for the H II regions of 18 irregular and related galaxies are determined from Hα plates. Almost without exception the integral diameter distribution fits an exponential law of the form previously deduced by van den Bergh (1981). The slopes are not correlated with observational or instrumental parameters, and are thus intrinsic to the galaxies. They show a strong correlation with galaxy luminosity in the sense that the less luminous galaxies have the steeper slopes. Six galaxies in the sample have significantly anomalous largest H II regions, a fact that suggests that giant H II regions are a separate class of objects that are formed by a different mechanism from that normally governing H II region sizes. (20 refs.)

121751 Planetary nebulae with massive nuclei. I. Time-dependent photoionization models. R.Tylenda (Lab. of Astrophys., Copernicus Astron. Center, Torun, Poland).
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.299-306 (Oct. 1983).
Massive nuclei ($M\gtrsim1$ $M_\odot$) of planetary nebulae evolve on a time scale comparable to the recombination time in a typical planetary nebula. The ionization and thermal structure of such a nebula can be far equilibrium conditions. Time-dependent photoionization models of planetary nebulae with a 1.2 $M_\odot$ nucleus are constructed. Initially, when the central star is luminous, a nebula is quickly ionized by an intense flux of ionizing photons (photoionization epoch). After the nuclear fuel has been exhausted the luminosity of the stars is dropping. The reduced flux of ionizing radiation can maintain ionization in the innermost layers of the nebula. The outer nebular regions are now recombining and cooling off (recombination epoch). The recombination epoch is usually much longer than the photoionization epoch. Time-dependent effects are observed during the recombination epoch. (11 refs.)

121752 VLA synthesis of H I absorption toward Sgr A. H.S.Liszt (Nat. Radio Astron. Obs., Charlottesville, VA, USA), J.M.van der Hulst, W.B.Burton, M.P.Ondrechen.
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.341-51 (Oct. 1983).
Synthesizes H I absorption against Sgr A using the VLA with 12″ angular resolution and 6 km s^{-1} velocity resolution over the range -300 km $s^{-1}\lesssim250$ km s^{-1}. To support the analysis of these observations the authors have also observed ^{12}CO emission on a 45″ grid near Sgr A using the 36-foot NRAO telescope on Kitt Peak. H I absorption features are found at all velocities in the range -200 km $s^{-1}\lesssim v\lesssim140$ km s^{-1} lies exclusively beyond the Sgr A continuum, because at other velocities the H I optical depth and ^{12}CO brightness temperature peaks coincide. Gas at 40-60 km s^{-1} absorbs against the compact source, indicating that both the East and West continuum components lie behind this gas. (29 refs.)

121753 Cooling of primeval gas by molecular hydrogen. Yu.I.Izotov.
Astrometriya & Astrofiz. (USSR), no.49, p.48-55 (1983). In Russian.
Calculations are made for the gas cooling rate by molecular hydrogen $\Lambda_{H(2)}$ at $T=10^2\text{-}10^4$K and particle concentration $n=1\text{-}10^7$ cm^{-3}. The gas is supposed to consist of atomic hydrogen only with a small admixture of H_2 molecules. It is shown that under conditions of rarefied primeval gas, $\Lambda_{H(2)}$ is considerably smaller than the cooling rate corresponding to the Boltzmann distribution of H_2 molecules on rotational and vibrational levels. The Boltzmann distribution is set in for rotational and vibrational levels at $n\geq10^5\text{-}10^6$ cm^{-3} and $n\geq10^7$ cm^{-3} respectively. (18 refs.)

121754 Helium atoms in the interstellar and interplanetary medium. I. Observations of scattered ultraviolet emission in H I (1216 Å) and H I (584 Å) lines from the Prognoz-5 and Prognoz-6 satellites. M.S.Burgin, V.G.Kurt, E.N.Mironova, V.I.Prokhorenko, N.A.Eismont, J.L.Bertaux, F.Dalaudier.
Cosmic Res. (USA), vol.21, no.1, p.72-82 (Jan.-Feb. 1983). Translation of: *Kosm. Issled. (USSR)*, vol.21, no.1, p.83-94 (Jan.-Feb. 1983). [received: Sept. 1983]
The technique and the results of observations in the joint Soviet-French experiment on the measurement of scattered ultraviolet emission in the interplanetary medium in the lines of H I (1216 Å) and He I (584 Å) are described. A four-channel photometer was mounted in the two high-apogee satellites Prognoz 5 and Prognoz 6. Scanning was accomplished by the rotation of the satellites about an axis directed toward the Sun. A cell with hydrogen was mounted in the H I L_α channel to measure the L_α line width. All the parameters related to the motion of the Sun in the interstellar medium were determined. (12 refs.)

121755 The origin of the Gum Nebula. F.C.Bruhweiler (Dept. of Phys., Catholic Univ. of America, Washington, DC, USA), M.Kafatos, J.C.Brandt.
Comments Astrophys. Comments Mod. Phys. Part C (GB), vol.10, no.1, p.1-14 (1983).
The Gum Nebula, with a diameter of at least 36° as delineated by H-alpha filaments, is one of the largest structures in angular extent in the sky. Placing the center of the Gum Nebula at 400 pc yields a radius of 125 pc for the arcuate structure. Juxtapositioned upon it is the Vela supernova remnant, presumably from a recent supernoval event occurring less than 20000 years ago. For the origin of the nebula, the authors identify four basic models. The authors present a critical overview of the recent work dealing directly or indirectly with the Gum Nebula. In so doing they focus their efforts on work since the 1971· Goddard conference, the last formal organized meeting to study the Gum nebula. (51 refs.)

121756 Gamma-ray line features from the Crab Nebula in the energy range 5-2000 keV. C.A.Ayre, P.N.Bhat, Y.Q.Ma, R.M.Myers, M.G.Thompson (Dept. of Phys., Univ. of Durham, Durham, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.285-95 (Oct. 1983).
Results are presented of an experiment to search for γ-ray lines from the Crab Nebula region in the energy range 50-2000 keV using a cooled intrinsic germanium detector in a sodium iodide anti-coincidence shield. Some evidence for line features is observed at 404.4 and 1049.6 keV with intensities at the top of the atmosphere of $(7.2\pm2.1)\times10^{-3}$ and $(1.9\pm0.4)\times10^{-2}$ photons cm^{-2} s^{-1} respectively. A line at 78.9 keV has also been detected which shows some variability with time. (17 refs.)

121757 OH maser emission at 4765 MHz in W3. F.F.Gardner, J.B.Whiteoak (Div. of Radiophys., CSIRO, Epping, Australia), P.Palmer.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.297-302 (Oct. 1983).
VLA observations of 4765-MHz OH masers have been made towards W3(OH) and W3 (cont.) with a resolution of 1.3 arcsec. For W3(OH) the maser emission centres are in four groups located within a region of size arcsec (10^{-2} pc) superimposed on the western side of the continuum distribution. The positions do not correspond with those of the 1.6-GHz OH masers which are considerably more distributed in declination. For W3 (cont.) the maser is located within 2 arcsec of IRS 5, the infrared source which has no detectable radio continuum but is the brightest pre-main-sequence object known at 20 μm. The peak maser gain for W3(OH) is $\sim10^2$ and for W_3

(cont.) $>10^4$. The latter laser varies with time, which is consistent with its higher maser gain. (17 refs.)

121758 Soft X-rays from very young supernova remnants. N.M.Berman, F.D.Kahn (Dept. of Astron., Univ. of Manchester, Manchester, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.303-8 (Oct. 1983).
A dynamical model of the very early evolution of a supernova remnant suggests that copious emission of X-rays will occur in the first 10 years. The radiation is largely in spectral lines in the range from 20 to 50 Å and will be most easily observable towards the end of the first decade. The effect should be detectable, using state-of-the-art instruments, in any supernova occurring within 23 Mpc. (8 refs.)

121759 Time-dependence chemistry. I. Modelling of a static cloud. G.D.Watt (Math. Dept., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.321-35 (Oct. 1983).
A computer program is developed to study the chemical evolution in interstellar clouds. This time-dependent treatment allows both the gas kinetic temperature and the total particle density to be rapidly varying functions of time. Such modelling would be appropriate for hot post-shock gas, circumstellar material around cool stars and expanding or collapsing clouds. The author describes the modelling procedure and explains some general results obtained using a basic time-dependent programme for a quiescent, static cloud of constant density and kinetic temperature. The results of each model are extremely sensitive to the input values used for elemental abundances and the initial fraction of H_2, but the equilibrium values of the molecular densities do not depend on the initial distribution of carbon amongst the species C, C^+ or CO. (17 refs.)

121760 Monte Carlo estimation of polarization in reflection nebulae. R.F.Warren-Smith (Phys. Dept., Univ. of Durham, Durham, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.337-47 (Oct. 1983).
A Monte Carlo technique is described for estimating the Stokes parameters of light which has undergone multiple scattering in a model reflection nebula. The method has the advantage of much improved efficiency over previous methods and is also applicable to more general nebular geometries. (19 refs.)

121761 Multiple scattering in the reflection nebula NGC 1999 and the nature of interstellar dust. R.F.Warren-Smith (Phys. Dept., Univ. of Durham, Durham, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.349-58 (Oct. 1983).
A model of the reflection nebula NGC 1999 is developed, which accounts for the available surface brightness, polarization and colour data in terms of multiple scattering of light within a large dust cloud. The results indicate a high albedo for the dust and a low value for the refractive index, possibly due to icy grain mantles. The data are best accounted for if the distribution of grain sizes $n(a)$ is approximately power law with an index -4.24 ± 0.18 in the approximate size range $0.1<a<0.5$ (μm). The observations are consistent with optical interstellar extinction data but the ultraviolet extinction appears to require the index of the power law to be less negative for small grain sizes. (23 refs.)

121762 Analysis of nebulosity in the planetary nebula NGC 40. R.E.S.Clegg, M.J.Seaton (Dept. of Phys. & Astron., Univ. Coll. London, London, England), M.Peimbert, S.Torres-Peimbert.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.417-34 (Oct. 1983).
Optical and *IUE* spectra of a bright region of nebulosity in the planetary nebula NGC 40 are combined for an analysis of the physical conditions and abundances in the nebula. Resulting abundances are typical of planetary nebulae and indicate that the nebulosity does not share the extreme abundances of the Wolf-Rayet WC8 central star. The continuum observed in the *IUE* spectra at an offset position is fitted to a calculated nebular continuum; the nebular lines are measured relative to the continuum and hence put on the same scale as optical lines measured relative to Hβ. The emission in C IVλ1549 from the nebula may be explained, in part, as due to resonance scattering of radiation from the star or the inner part of the nebula. New recombination lines of C II are identified in *IUE* spectra; their intensities relative to C II $\lambda\lambda$4267, 7230 in NGC 40 and IC 418 are analysed. (39 refs.)

121763 On the physics and chemistry of interstellar matter II. M.Winnewisser (Phys.-Chem., Inst., Justus-Liebig-Univ., Giessen, Germany), G.Winnewisser.
Phys. Bl. (Germany), vol.39, no.8, p.289-95 (Aug. 1983). In German.
For pt.I see ibid., vol.39, no.1, p.9 (1983). Since 1968 more than 50 different molecules have been identified by their absorption and emission spectra in dense concentrations of interstellar gases, mainly in the millimetre wave region. Molecules, ions and radicals which are extremely unstable chemically exist simultaneously with well-known stable molecules. Interstellar isotopic ratios differ from terrestrial ones by a factor of 2 or 3, and this can be explained by stellar nuclear synthesis since the formation of the Solar System. The formation of molecules takes place in the gas phase mainly through ion-molecule reactions and on the surfaces of the interstellar dust. Measurements of the interstellar D:H isotopic ratios confirm the pre-galactic origin of deuterium and hence the big bang theory. The terrestrial plasma chemistry of interstellar molecules is discussed with particular reference to the instruments of mm wave spectroscopy, the detection of new molecules, and the mm wave spectrum of isocyanamide. By means of examples an attempt is made to clarify the relationship between laboratory spectroscopy and space spectroscopy. (26 refs.) *D.J.B.*

121764 High-sensitivity observations of HD 44179: the Red Rectangle. B.J.Geldzahler (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), N.L.Cohen.
Publ. Astron. Soc. Pac. (USA), vol.95, no.570, p.489-90 (Aug. 1983).
The authors have observed the Red Rectangle (=HD 44179) with the VLA at 1.465 and 4.885 GHz in search of nonthermal radio emission similar to that of SS 433 due to a suggestion by Webster (1979). To very sensitive limits, there is no radio emission from the Red Rectangle at these frequencies. If it is an SS 433-like object, then its radio-emission intensity is less than $10^{-6.5}$ that of SS 433, which contradicts the similarity in energetics seen in the 'Doppler' broadened optical line profiler of the Red Rectangle. However, the lack of radio emission is consistent with the presence of a bipolar nebula, which would have a 'pressure' broadened profile. (9 refs.)

121765 Photographic infrared observations of planetary nebulae. D.J.MacConnell (Centro de Investigacion de Astron., Merida, Venezuela).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.39-43 (June 1983).
Presents the results of an inspection of 740 planetary nebulae on spectrum plates taken in the near infrared. The author confirms the elimination of 48 objects as late-type stars discovered previously by other authors, and eliminates 20 more for the first time on the same basis. Additionally, the author presents another 122 supposed PN which do not show H-alpha emission on the red plates. (20 refs.)

121766 Internal motions in H II regions. XII. S162 and NGC 7635. P.Pismis, M.A.Moreno, I.Hasse (Inst. de Astron., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.51-7 (June 1983).
For pt.XI see ibid., vol.5, no.3, p.209-12 (1982). The apparent structure of S162 and of the Bubble Nebula (NGC 7635) associated with it is discussed using a number of direct images taken through narrow band (10 Å) interference filters in Hα, [N II] and in the continuum at λ6607. The results are discussed together with the radial velocity field of S162 and in particular of the Bubble Nebula as obtained from photographic Fabry-Perot interferometry. The Bubble Nebula is shown to be composed of distinct and amorphous very regularly curving arcs, all inscribed on a tenuous slightly ellipsoidal shell of gas expanding at velocity of about 4 km s^{-1}. The arcs are probably genetically related to the globules which form the characteristic cometlike feature within the Bubble Nebula. The ionization source of S162 is BD+60°2522 and O7I_bf star classified from the high dispersion spectrum. (20 refs.)

121767 The optical emission of the SNR 3C 400.2. M.Rosado (Inst. de Astron., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.59-62 (June 1983).
Narrow band imagery and Fabry-Perot interferometry have been performed on the optical counterpart of this remnant. The Hα and [S II] photographs confirm the high [S II]/Hα ratio already found by spectroscopic means in one of the optical filaments. These photographs also show a series of sharp and bright filaments arranged in a crescent-shaped nebulosity; some of these filaments are oriented in the radial direction. The [O III] photograph reveals the existence of a filament without any Hα counterpart. The kinematical data imply a distance of 6.7 ± 0.6 kpc to this remnant and an expansion velocity of 60 ± 10 km s^{-1}. These values imply that the supernova remnant is in its radiative phase of evolution and that it has an old age. (20 refs.)

121768 Internal motions in H II regions. XIII. The velocity field of Sharpless 184. I.Hasse (Inst. de Astron., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.83-7 (June 1983).
For pt.XII see ibid., vol.8, no.1, p.51-7 (1983). The H II region S184 (NGC 281), presumed to be an evolved one, is situated in the Perseus Arm at a distance of about 2 kpc. The optical extension of the region of around 5 pc shows in projection a complex of different layers of gas and clouds around the central region. This complex has been object of detailed studies before. An H_2O maser discovered earlier has suggested that it marks the site of star-formation. The author gives an extensive radial-velocity field covering the region. (26 refs.)

121769 The infrared spectrum of hypersthene and the interstellar silicate component. J.Dorschner, C.Friedmann, J.Gurtler (Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.133-8 (1983). In English.
The mass absorption coefficient for hypersthene in the wavelength interval from 8 to 40 μm is derived from spectra for submicrometer-sized grains. The wavelength position and shape of the interstellar 10- and 20-μm silicate features match rather well if the high disorder of the crystal lattice expected under interstellar conditions is taken into account. (14 refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

121770 A deep survey of galaxies. R.P.Kirshner (Dept. of Astron., Univ. of Michigan, Ann Arbor, MI, USA), A.Oemler, P.L.Schechter, S.A.Shectman.
Astron. J. (USA), vol.88, no.9, p.1285-300 (Sept. 1983).
The authors present a sample of galaxies in six fields, each of area 2 sq. deg., located in the North and South galactic polar caps. Photoelectrically calibrated photographic magnitudes and $J-F$ colors have been determined for 512 galaxies brighter than completeness limits which range from $F=16.5$ to $F=17.2$ among the fields. Velocities, with typical accuracies of 150 km s^{-1}, have been obtained for 280 of the brighter galaxies. Using these data and previously published work, the authors determine the general galaxy luminosity function parameters to be $M_F{}^*=-22.7$, $\alpha=-1.25$, and the mean visual luminosity density of the Universe to be $\rho=2.3\times10^8\ h\ L_\odot$ Mpc^{-3}. Assuming $M/L_v=300$ h, this implies $\Omega\simeq0.26$. (21 refs.)

121771 Photoelectric comparison sequences in the fields of four BL Lacertae objects. H.R.Miller, T.L.Mullikin, B.Q.McGimsey (Dept. of Phys. & Astron., Georgia State Univ., Atlanta, GA, USA).
Astron. J. (USA), vol.88, no.9, p.1301-3 (Sept. 1983).
Photoelectric comparison sequences in the fields of four previously identified BL Lacertae objects have been calibrated in order to encourage long-term photometric studies of these objects. (9 refs.)

121772 Neutral hydrogen observations of double spiral galaxies. III. NGC 3504/3512, NGC 4085/4088, IC 65/UGC 622, NGC 797/801. G.A.van Moorsel (Kapteyn Astron. Inst., Univ. of Groningen, Groningen, Netherlands).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.1-18 (Oct. 1983).
For pt.I see ibid., vol.53, no.2, p.271-86 (1983). Four binary systems have been observed in the 21 cm neutral hydrogen line with the WSRT. All 8 galaxies have been detected; in the field of IC 65/UGC 622 two additional systems containing hydrogen were found. For these ten galaxies systemic velo-

cities and rotation curves have been derived, and the total mass of each system has been determined in two ways: summing the results from the rotation curves, and calculating the minimum mass which follows from the orbital motion. In two of the four systems (NGC 3504/12 and IC 65/UGC 622) the minimum orbital mass is larger than the mass deduced from the rotation curves. (19 refs.)

121773 Neutral hydrogen observations of double spiral galaxies. IV. NGC 4618/4625, NGC 4016/4017, NGC 3725/UGC 6528, UGC 725/728, NGC 2336/IC 467. G.A.van Moorsel (Kapteyn Astron. Inst., Univ. of Groningen, Groningen, Netherlands).
Astron. & Astrophys. Suppl. Ser. (France), vol.54, no.1, p.19-37 (Oct. 1983).
For pt.III see ibid., vol.54, no.1, p.1-18 (1983). Results of a 21 cm H I line study of five binary galaxies observed in the 21 cm H I line with the WSRT are presented. All ten galaxies were detected in H I, and systemic velocities and rotation curves were determined. The results are discussed in terms of a point mass model for the orbital motion in the pair. Only in the case of the pair NGC 4016/4017 a minimum orbital mass was found which did not exceed the sum of the individual masses. For the other four pairs the individual masses are not sufficient to account for the observed radial velocity differences. (15 refs.)

121774 A near-infrared and optical study of X-ray selected Seyfert galaxies. I. Observations. C.W.McAlary, R.A.McLaren, R.J.McGonegal (Dept. of Astron., Univ. of Toronto, Toronto, Canada).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.341-62 (Aug. 1983).
The authors present broad-band photometric observations between 0.35 and 3.5 μm for a complete sample of pre-Einstein X-ray galaxies most of which are Seyfert-like in nature. For most of these objects, the flux increases rapidly from the optical into the infrared. Some of the distant, high-luminosity sources however, have relatively flat continua. Multiaperture measurements have been obtained for the nearby extended objects. These show that the stellar contribution to the nuclear light of low- and intermediate-luminosity Seyfert galaxies is often significant. (16 refs.)

121775 New central velocity dispersions for the bulges of 53 spiral and S0 galaxies. P.L.Schechter (Kitt Peak Nat. Obs., Tucson, AZ, USA).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.425-7 (Aug. 1983).
New measurements of velocity dispersions in the bulges of 53 spiral and S0 galaxies have been carried out using spectra obtained with the 1.5 m telescope at the Whipple Observatory and the 2.1 m telescope at KPNO. (16 refs.)

121776 Luminosity distribution in galaxies. II. A study of accidental and systematic errors with application to NGC 3379. M.Capaccioli (Osservatorio Astrofisico di Asiago, Univ. di Padova, Padova, Italy), G.de Vaucouleurs.
Astrophys. J. Suppl. Ser. (USA), vol.52, no.4, p.465-86 (Aug. 1983).
For pt.I see ibid., vol.40, no.4, p.699-731 (1979). Presents a sequel to a study of NGC 3370 as a luminosity distribution standard. Sources of accidental and systematic errors in ground-based photographic and photoelectric surface photometry of galaxies are discussed. Instrumental and atmospheric convolution effects are analyzed, in particular the structure of the point spread function with application to an E0 galaxy obeying $r^{1/4}$ law. Galactic and extragalactic effects including interstellar extinction and diffuse nebulosities at high latitudes, bright field stars, and galaxies are discussed. All these sources of error combine to restrict the domain of meaningful surface photometry of galaxies to $\mu_B \lesssim 28$ mag arc sec^{-2}. Even at brighter levels, $18 \leq \mu_B \leq 28$, true mean errors less than 0.1 mag are difficult to achieve. (68 refs.)

121777 Physical conditions in the nucleus of Seyfert galaxy NGC 7469. II. Spectrophotometric investigation. V.A.Mineva, G.T.Petrov, B.Z.Kovachev (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.713-16 (1983).
The physical parameters characterizing the nucleus are investigated. The observation material comprises: (a) two scanners including the region from 4000 to 7000 Å obtained on a four-metre telescope at the Kit Peak National Observatory in USA, with a spectral resolution of ~Å; (b) five spectra (obtained at positional angles of 51°, 81°, 111°, 141° and 171°) on a six-metre BTA telescope in USSR with a three-cascade IIS UM-92-dispersion of 46 Å/mm; and (c) a scanner including the region 3700-5300 Å, obtained on a five-metre telescope at Mt. Palomar Observatory in USA. Gas composition and electron densities are discussed. (9 refs.)

121778 Rotation, mass and physical conditions in nucleus of spiral galaxy NGC 7537. G.T.Petrov, V.A.Mineva, B.J.Kovachev, G.A.Kyazoumov (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.717-19 (1983).
NGC 7537 is actually a member of the double system NGC 7537+NGC 7541. NGC 7537 is referred to type Sbc; a bright nucleus and relatively faint spiral and clearly visible. The rotation curve and galactic structure are discussed. The spectra are also discussed. A stellar magnitude for its nucleus is derived. (9 refs.)

121779 The correlation between colour and line intensities in type-1 Seyfert galaxies. Y.Y.Zhou (Univ. of Sci. & Technol. of China, Hefei, China), T.Kiang, F.H.Cheng.
Irish Astron. J., vol.15, no.4, p.281-7 (Sept. 1982). [received: Sept. 1983]
(Proceedings of the Meeting of the Astronomical Science Group of Ireland, Belfast, Northern Ireland, 15 Dec. 1981).
Examines the correlation between the line luminosity F and equivalent width W of the Hβ and the [O III] λ5007 lines of type-1 Seyfert galaxies and their 'generalized colour differences' $Q_a=(U-B)-a(B-V)$. The authors find that the correlation is strongest for a~1/2. This result suggests that $Q_{1/2}$ rather than $U-B$ better monitors the strength of the radiation beyond the Lyman limit in the nucleus, responsible for producing the emission lines. The authors find that the variation of W [O III] with $U-B$ is in the same sense as that of W(Hβ), in contrast to a previous result by Arakelyan (1977). The authors confirm and extend Petrov's (1979) finding that F gave better correlations than W did, but noted that they also showed much greater dispersions about the regression line. From this the authors infer that there must be a high and positive correlation between F and K, the continuum luminosity at the line concerned, which is duly confirmed for the case of Hβ. (13 refs.)

121780 CCD surface photometry of two southern active galaxies, NGC 1316 1052. D.Carter (Mount Stromlo & Siding Spring Obs., Woden, Australia), P.R.Jorden, D.J.Thorne, J.V.Wall, J.C.Straede.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.377-88 (Oct. 1983).
Presents surface photometry in five wavebands (*UBVRI*) of two southern active elliptical galaxies, NGC 1316 and 1052, obtained with the recently commissioned RGO CCD camera on the AAT. The speed of the CCD camera enables one to take multiband exposures in quick succession, enhancing stability of the conditions. The authors demonstrate the linearity and stability of the CCD and show that surface photometry is accurate over a wide dynamic range. The morphology of the dust lane in NGC 1316, and the nature of the very red core and a diffuse dust lane in NGC 1052 are discussed. (35 refs.)

121781 8-13 μm spectrophotometry of galaxies. III. The silicate absorption in Markarian 231. P.F.Roche, D.K.Aitken, B.Whitmore (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.21p-6p (Oct. 1983).
Spectrophotometry at 8-13 μm of Mkn 231 confirms that the 10 μm minimum is due to large columns of silicate dust in the line-of-sight to the nucleus. Fits to the detailed spectral shape demonstrate that the cool absorbing grains are at the emission (z-0.042) rather than the absorption ($z\sim0.025$) redshift and are located within the nuclear region. (24 refs.)

121782 Interferometric study of NGC 4945. G.J.Carranza, E.L.Aguero (Obs. Astron., Cordoba, Spain).
Observatory (GB), vol.103, no.1056, p.257-9 (Oct. 1983).
Hα interferometric observations of NGC 4945 are discussed. A tentative explanation of the kinematical features is proposed. (6 refs.)

121783 Spectral evolution of galaxies. IV. A catalogue of theoretical predictions of cosmological interest. A.G.Bruzual (Centro de Investigacion de Astron., Merida, Venezuela).
Rev. Mex. Astron. & Astrofis. (Mexico), vol.8, no.1, p.63-81 (June 1983).
Presents in the form of numerical tables a set of results from Bruzual's (1981) spectral evolutionary models for galaxies. (14 refs.)

98.50K Groups, clusters, superclusters

121784 Diffuse radio emission from the Coma cluster of galaxies at decametre wavelengths. C.V.Sastry (Indian Inst. of Astrophys., Bangalore, India), R.K.Shevgaonkar.
J. Astrophys. & Astron. (India), vol.4, no.1, p.47-51 (March 1983). [received: Oct. 1983]
The region of the Coma cluster has been observed at 34.5 MHz with a resolution of 26×40 arcmin. A map of the diffuse halo (Coma C) is presented. The size of the halo is found to be 54×30 arcmin. The position angle is 50°±10° and the integrated flux is 60±11 Jy. An extended source has also been found to the south of Coma A. The measured half-power widths of this source are 30×40 arcmin. The position angle is 135° and the integrated flux is ~15 Jy at 34.5 MHz. The spectral index in the frequency range 408 to 34.5 MHz is −1.0. It is suggested that this source also belongs to the Coma cluster. (17 refs.)

Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.311-19 (Oct. 1983).
Presents 4995 MHz observations of 22 radio galaxies from the B2 catalogue. The most frequent type of radio structure found in this sample is the classical double, with linear sizes ranging from tens to hundreds of kpc. Detected degrees of polarized flux density range from 2% to 23%. The orientation of the projected magnetic field is mostly perpendicular to the source major axis. (27 refs.)

121787 4.8-GHz H_2CO maser emission in Sgr B2. J.B.Whiteoak, F.F.Gardner (Div. of Radiophys., CSIRO, Epping, Australia).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.27p-32p (Oct. 1983).
VLA observations with an angular resolution 2 arcsec have resulted in the discovery of five 4.8-GHz H_2CO masers in the H II-regionmolecular-cloud complex Sgr B2. Only one other H_2CO maser is known (in NGC 7538). Observed with a velocity resolution of 6 km s^{-1}, the maser intensities ranged from 15 to 140 mJy. The strongest masers are located close to H II continuum emission and OH4 and H_2O masers. (9 refs.)

98.70J Quasars

121788 The Cerro El Roble sample of faint ultraviolet excess objects in the South Galactic Pole. L.E.Campusano, C.Torres (Dept. de Astron., Univ. de Chile, Santiago, Chile).
Astron. J. (USA), vol.88, no.9, p.1304-22 (Sept. 1983).
As a first step towards the formation of a QSO sample in the South Galactic Pole (SGP), a 44-deg^2 area centered at $RA=00^h53^m$ (1950) Decl.$=-28°03'$ has been searched for relative ultraviolet excess objects (UVXs) in five partially overlapping fields of the 70/100-cm Maksutov telescope using an unmodified Zeiss Blink comparator. A total of 373 objects was found which yielded a surface density of 8.6 UVX/deg^2 with $B \lesssim 20$ mag. The search was found to be extremely incomplete at $B > 19$ mag, while the completeness for $B \lesssim 19$ was estimated to be approximately 30% in nonoverlapping regions and 50% in overlapping regions. Only the central overlapping region was used for the comparison of the surface density of different UVX samples. The surface density in this region is 7.2 UVX/deg^2 at $B \sim 19$ mag and approximately a factor of 2 larger than the one found by Savage and Bolton (1979) in two 25-deg^2 fields near the SGP. In addition, the surface density value is a factor of 3/2 larger than the density found by Bracessi, Formiggini, and Gandolfi (1970) near the North Galactic Pole. With respect to the behavior of the cumulative number of the UVX ($N(<B)$) as a function of the blue magnitude, it was found in reasonable agreement with those corresponding to the samples of Haro and Luyten (1962), Braccesi et al. (1970), and Usher (1981). Twenty-seven new QSOs have been preliminarily identified in the UVX sample from spectroscopic data collected on the Las Campanas 2.5-m telescope. With this result, the presently known surface density of QSOs in the 44-deg^2 area amounts of 0.8 QSO/deg^2 at $B \sim 19$ mag, which is about 1/5 of the expected surface density. The fraction of stars encountered in the preliminary spectroscopic evaluation was found to approximately coincide with the expected values. Finally, a statistical test applied to the surface distribution of the UVXs in the central 25-deg^2 region, gave a slight suggestion of nonuniformity when the counts were made with cells of 0.3 deg^2. (34 refs.)

121789 Photometric television observations of ten peculiar extragalactic objects. L.P.Metik, V.V.Prokof'eva.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.148-54 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.140-5 (1981). [received: Oct. 1983]
The high-sensitivity television system working in conjunction with the 0.5-m telescope of the Crimean Astrophysical Observatory was used in 1976 to determine the brightness of extragalactic objects in the BV color system. Five quasars and BL Lac objects with magnitudes in the range between 14.5 and 18.5^m were observed. Three objects (3C 279, OJ 287, and OY 091) exhibited light variation with a characteristic time of a few days. (6 refs.)

121790 Compact structure in the powerful distant radio source 4C 04.81. P.D.Barthel (Sterrewacht Leiden, Leiden, Netherlands), C.J.Lonsdale.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.395-402 (Oct. 1983).
A radio map of the high-redshift quasar 4C 04.81 from MERLIN at λ 6 cm and a two-component model derived from λ 21-cm European VLBI Network observations are presented. The MERLIN map shows a curved jet leading from the radio core to a bright compact hotspot. Despite the high angular resolution of these observations (<0.1 arcsec), most of the source flux at both frequencies originates in unresolved features. Significantly, it is found that the core component has a steep radio spectrum $\alpha \approx -0.8$ ($S \propto \nu^{\alpha}$). (16 refs.)

121791 Broad emission lines of QSOs are consistent with rotating supermassive stars. G.A.Shields (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Nature (GB), vol.305, no.5933, p.407-9 (29 Sept. 1983).
Quasars and Seyfert galaxies typically have optical and UV spectra characterized by a largely nonthermal continuum, narrow emission lines, and broad emission lines (full widths at zero intensity $\sim 10^4$ km s^{-1}) observed only in permitted and intercombination transitions. The broad lines come from a small amount of dense, fast-moving gas, in a region $\sim 10^{18}$ cm across near the continuum source. The origin, geometry, and dynamics of the broad line gas are uncertain. It is suggested that the basic properties of the broad emission-line profiles are consistent with emission from the surface of a rotating, supermassive star. (27 refs.)

121792 Are quasars really far away?. J.V.Narlikar (Tata Inst. of Fundamental Res., Bombay, India).
New Sci. (GB), vol.99, no.1377, p.920-2 (29 Sept. 1983).
Discusses the redshift of quasars—and considers the possibility of nearby quasars. A possible mechanism for nearby quasars in the intergalactic medium is discussed. (no refs.)

98.70Q X-ray and gamma-ray sources

121793 Possible nature of the gamma-source 2CG 195+04. B.M.Vladimirskii.
Bull. Crimean Astrophys. Obs. (USA), vol.63, p.155-60 (1981). Translation of: *Izv. Krym. Astrofiz. Obs. (USSR)*, vol.63, p.146-50 (1981). [received: Oct. 1983]
It is suggested that the gamma-source 2CG 195+04 may be a remnant of the supernova explosion of AD 437. This is consistent with existing observational data if the object belongs to the subclass of supernovae without well-defined shell structure (plerions). The spectral index of the source in the radio range is probably $\alpha \lesssim 0.2$, and the flux near 1 GHz is not more than 1 flux unit. In the optical range, this is a weak extended object with a continuous spectrum. The emission recorded in the X-ray range may be due to the pulsar halo. The period of the pulsar is probably about 50 msec. The radio pulsar 2CG 195+04 is probably several times weaker than NP 0532. (22 refs.)

98.70V Background radiations

121794 Structure of the cosmic microwave background. J.D.Barrow, R.Juszkiewicz, D.H.Sonoda (Astron. Centre, Univ. of Sussex, Brighton, England).
Nature (GB), vol.305, no.5933, p.397-402 (29 Sept. 1983).
Predicts the structure expected in the cosmic microwave background over large angular scales in realistic anisotropic and inhomogeneous universes. In a homogeneous anisotropic Universe there exist two possibilities, a quadrupole or a hotspot pattern with and without dipole contributions. A hotspot allows a direct observational test of an open Universe. The authors show how infinite wavelength inhomogeneous perturbations of the Friedman Universe can be represented as ensembles of different homogeneous universes. (30 refs.)

121795 Mantle plume noble gas component in glassy basalts from Reykjanes Ridge. R.Hart, J.Dymond, L.Hogan (School of Oceanography, Oregon State Univ., Corvallis, OR, USA), J.G.Schilling.
Nature (GB), vol.305, no.5933, p.403-7 (29 Sept. 1983).
Basalts from the Reykjanes Ridge contain noble gases delivered from the non-degassed lower mantle by the Iceland plume. These lower mantle gases are thought to be a mixture of planetary and solar components, as would be expected if the Earth accreted from fine silicate particles. (42 refs.)

98.80 COSMOLOGY

121796 The influence of quantum effects on the space-time structure in the neighbourhood of singularities in the general theory of relativity. B.B.Palyushev.
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.767-70 (1983). In Russian.
The fundamental problem of theories of the formation of galaxies and galaxy clusters is that of finding the spectrum of the heterogeneities that gave birth to the present coarse-scale structure of the global Universe. Some of the envisaged ways of finding this spectrum and their theoretical bases are briefly described. It is then postulated that future identification of a black hole in the Cosmos and observation of all available parameters around it could yield information on the nature of the perturbations giving rise to the cosmic heterogeneities, on the assumption that quantum effects taking place in the gravitational field of a black hole can cause some instability in the gravitational background. This hypothesis is analysed on the basis of the relationship between the degree of instability and the temperature of Hawkins radiation. (8 refs.) *A.J.B.*

121797 Topology of the large-scale structure of the Universe. S.F.Shandarin, Ya.B.Zeldovich (Space Res. Inst., Moscow, USSR).
Comments Astrophys. Comments Mod. Phys. Part C (GB), vol.10, no.1, p.33-45 (1983).
Discusses properties of galaxy distribution on scales from a few to several hundred Mpc. The authors analyze in detail the pattern formed by galaxy density enhancements and discuss a new technique for quantitative study of the structural topology. (48 refs.)

121798 Compatibility of a closed singular universe with present observational data. A.G.Agnese, M.La Camera (Istituto di Sci. Fisiche, Univ. Genova, Genova, Italy).
Int. J. Theor. Phys. (USA), vol.22, no.9, p.867-71 (Sept. 1983).
The influence of the constant term Λ on the cosmological equations is investigated. It is shown that a closed singular universe is possible even with the

presently known matter and radiation densities, provided that the universe age is restricted to a suitable range. (9 refs.)

121799 The cosmological problem as initial value problem on the observer's past light cone: geometry. G.Dautcourt (Zentralinst. fur Astrophys., Akad. der Wissenschaften, Potsdam-Babelsberg, Germany).
J. Phys. A (GB), vol.16, no.15, p.3507-28 (21 Oct. 1983).
In the context of general relativity an approach to cosmology is suggested which rests exclusively on quantities accessible to the astronomical observer. The approach is based on the characteristic initial value problem for the Einstein field equations imposed on the observer's past light cone. the inner geometry of the past light cone enters the relations between observable quantities. Thus, it should become possible to determine both the cone geometry, as well as the distribution of cosmic matter near the cone, without adopting arbitrary assumptions. The propagation equations determine the gravitational field and the matter distribution at finite distances from the past cone. The author specifies the cone initial data for a general dust model. An explicit procedure in terms of successive integrations is given to determine the gravitational field near the past light cone. (18 refs.)

121800 The cosmological evolution of general Bianchi models in the adiabatic regime. P.Salucci, R.Fabbri (Istituto di Fisica Superiore, Univ. di Firenze, Firenze, Italy).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.62-72 (11 Sept. 1983).
The authors analyse the evolution of homogeneous anisotropic cosmologies in the adiabatic regime allowing for a cosmic velocity field and taking into account the contribution of the quantum vacuum to the cosmic energy density. They show that a constant or slowly varying energy-momentum tensor of vacuum isotropizes the Hubble expansion. They suggest, therefore, that an imperfect tuning of field parameters in grand unified theories may naturally explain the isotropy of the Universe. (13 refs.)

121801 Gravitational instability for a multifluid medium in an expanding universe. D.Fargion (Istituto di 'Fisica G. Marconi', Univ. di Roma, Roma, Italy).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.111-27 (11 Sept. 1983).
Considers the gravitational clustering of a multicomponent fluid in an expanding Newtonian universe, taking into account the mutual gravitational interactions of the medium. The author obtained a set of exact and approximate solutions for two fluid components and for several fluid components: primordial hydrogen and helium or cosmological massive neutrinos of different masses and/or velocity distribution may be described by these solutions. The ratio between the two fluid perturbations, even if originally equal to unity, changes monotonically with time; this phenomenon leads to different epochs for nonlinear clustering that may be reflected into different epochs of galaxy formation. (10 refs.)

121802 Quantum dissipative processes and gravitational entropy of the Universe. B.L.Hu (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.368-74 (26 Sept. 1983).
The author discusses the meaning of gravitational entropy of the Universe when quantum dissipative processes like cosmological particle production are important and proposes to use the entropy generated in these processes as a measure of the change in gravitational entropy of the spacetime dynamics. Penrose's Weyl Curvature Hypothesis is re-examined in this generalized context. It is shown that gravitational entropy defined as such can actually decrease in the quantum regime by the action of vacuum viscosity. The theoretical and cosmological implications of this postulate is discussed. (23 refs.)

121803 Weyl integrable space-time: a model of our cosmos?. M.Novello, H.Heintzmann (CBPF/CNPq, Rio de Janeiro, Brazil).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.10-11 (3 Oct. 1983).
The authors introduce a Weyl integrable space-time as a consequence of a dynamical process. They study the particular case of a vector field nonminimally coupled to gravity. The consequences for cosmology are considered. They find that it is possible to connect one Riemannian region of space-time with another Riemannian region of space-time by a series of Weyl integrable domains. (7 refs.)

121804 The expansion law of the void in the expanding Universe. H.Sato, K.Maeda (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.119-27 (July 1983).
The expansion of a spherical less-dense region (void) in the expanding Universe is analyzed. Because of a rapid expansion of the void, the surrounding matter is compressed to a thin dense shell and the mass of the shell increases by a snowplow mechanism. The rapid expansion of the void would be interpreted as a 'little bang' caused by the curvature fluctuation in the expanding universe. (14 refs.)

121805 Cosmology from higher-dimensional gravity. Q.Shafi (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), C.Wetterich.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.387-91 (6 Oct. 1983).
A scenario describing how the four-dimensional Friedmann cosmology may evolve from a model of gravity in $4+D$ dimensions which admits spontaneous compactification of D dimensions is presented. In particular, the possibility that the transition to the standard hot big bang model involves an inflationary phase is explored. (10 refs.)

121806 An alternate derivation of radiation in an inflationary universe. R.H.Brandenberger (Jefferson Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.397-400 (6 Oct. 1983).
The authors derive the nontrivial nature of the quantum field vacuum state in the de Sitter phase of an inflationary universe by explicity calculating the vacuum expectation value of the energy-momentum tensor of a free massless scalar field. This yields an independent verification of the occurrence of Hawking radiation. (11 refs.)

121807 Note on Euclidean Bianchi-type 'cosmologies'. B.K.Berger (Phys. Dept., Oakland Univ., Rochester, MI, USA), A.G.Spero.
Phys. Rev. D (USA), vol.28, no.6, p.1550-1 (15 Sept. 1983).
AN explanation using 'qualitative cosmology' is given for the absence of chaotic behavior in the Euclidean analog of the Bianchi cosmologies. (11 refs.)

121808 The large-scale structure of the Universe. J.Silk, A.S.Szalay, Y.B.Zel'dovich.
Sci. Am. (USA), vol.249, no.4, p.56-64 (Oct. 1983).
Across billions of light-years space is a honeycomb of galactic superclusters and huge voids. The structure may result from perturbations in the density of matter early in the big bang. (no refs.)

Trace element determination by atomic spectroscopic methods−state of the art, (59 refs.)........120687
Tunguska event, (86 refs.)........121570
Two-dimensional turbulence influence on diffusion, (51 refs.)........118569
Ultrasound imaging, (64 refs.)........118339
Uniform GTD for diffraction by edges, vertices and convex surfaces, (50 refs.)........118058
Vapour phase growth of arsenic chalcogenide crystals and their characterization, (74 refs.)........120230
VHF radiowave communication by auroral backscatter, (52 refs.)........121450
World Ocean abyssal characteristics, (53 refs.)........121253

CONFERENCE INDEX

Advanced remote sensing; San Diego, CA, USA, 26-27 Aug. 1982, [1983] 116914 (introductory abstract),
Advances in ferrography; Swansea, Wales, 22-24 Sept. 1982, [15 Sept. 1983] 116927 (introductory abstract), 120451−3, 120580−3, 121046
Aerosol research; Washington, DC, USA, 18-21 April 1983, *(American Assoc. Aerosol Res)* [1983] 116918 (introductory abstract),
Aerosols in science, medicine and technology; Bologna, Italy, 14-17 Sept. 1982, *(Univ. Bologna; Consiglio Nazionale delle Ricerche)* [1983] 116920 (introductory abstract),
Astronomical Science group of Ireland; Belfast, Northern Ireland, 15 Dec. 1981, [Sept. 1982] 116919 (introductory abstract), 121537, 121779
Biorheology 1983; Baden-Baden, Germany, 20-24 Aug. 1983, [1983] 116912 (introductory abstract),
Cineradiography with photons or particles; Paris, France, 18-21 May 1981, *(CEA)* [1983] 117294−6, 118751, 120520, 120992−8, 121015, 121062
Deformation, yield and fracture of polymers; Cambridge, England, 29 March-1 April 1982, [London, England: Plastics & Rubber Inst. 1982] 116931 (introductory abstract), 120306, 120325, 120364−6, 120390−6, 120431−47, 120478−85, 120589−90
Desalination and water re-use; Florence, Italy, 23-27 May 1983, [May 1983] 116916 (introductory abstract),
Electro '82; Boston, MA, USA, 25-27 May 1982, [El Segundo, CA, USA: Electron. Conventions 1982] 118300, 120800, 120974, 120982, 121047
Fifteenth Hawaii International Conference on System Sciences 1982; Honolulu, HI, USA, 6-8 Jan. 1982, *(Univ. Hawaii; Univ. Southwestern Louisiana) W.Riddle, K.Thurber, P.Keen, R.H.Sprague Jr., B.Shriver, T.M.Walker, R.R.Grams (editor/s),* [HI, USA: Hawaii Int. Conference Syst. Sci. 1982] 121055
Frequency sharing, interference and system diversity; Issy-les-Moulineaux, France, 18-22 Oct. 1982, *H.Soicher (editor/s),* [Neuilly-sur-Seine, France: AGARD 1983] 116930 (introductory abstract), 117224, 118050, 121357−67, 121413, 121449−55
Grain boundaries; Liege, Belgium, 16-19 May 1983, [1983] 116921 (introductory abstract), 118828, 119026−31, 120194, 120337
Great Lakes; Oswego, NY, USA, 23-27 May 1983, [Buffalo, NY, USA: Int. Assoc. Great Lakes Res. 1983] 121378 (introductory abstract),
Hydrophobic interaction; Reading, Berks., England, 15-16 Dec. 1982, [1982] 118832 (introductory abstract), 116946, 117867, 117888, 118833−6, 118847−9, 119240, 119315, 120681, 120801
Image analysis, 3rd Scandinavian conference; Copenhagen, Denmark, 12-14 July 1983, *P.Johansen, P.W.Becker (editor/s),* [Lund, Sweden: Studentlitteratur 1983] 120858−9, 121408−9
Intense medium energy sources of strangeness; Santa Cruz, CA, USA, 18-21 March 1983, *(Santa Cruz Inst. Particle Phys.; Nat. Sci. Found. et al)* [1983] 116910 (introductory abstract), 117384−93, 117410, 117420, 117452−7, 117536, 117707, 117712−13
Interaction of electromagnetic waves with structures; Norwich, England, 23 July-4 Aug. 1979, *(NATO) J.K.Skwirzynski (editor/s),* [Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981] 116932 (introductory abstract), 118028, 118032, 118036−7, 118051−63, 118075−7, 120953−4, 120984
Laser 83 opto-electronics; Munchen, Germany, 27 June-1 July 1983, [Munich, Germany: Munchener Messe-und Ausstellungsgesellschaft 1983] 116929 (introductory abstract),
Laser optics; Leningrad, USSR, Jan. 1980, [1980] 118082, 118094, 118119, 118134, 118149, 118153−4, 118158, 118180−1, 118203−5, 118226, 118232, 118236, 118257, 118275, 118303, 119058, 121382
Liquid crystals; Bangalore, India, 6-10 Dec. 1982, [1983] 117109, 118213, 118870−81, 119083, 119192−4, 119245, 119312, 119658, 119673, 119929, 119943−4, 119979, 119981, 120019, 120026, 120077, 120805
Measurement methods and technology; Berlin, Germany, 24-28 May 1982, *K.Havrilla, J.Solt, T.Kemeny (editor/s),* [Amsterdam, Netherlands: North-Holland 1983] 117144−5, 117154, 117166, 117177, 117182, 117190, 117206, 117276, 117655−6, 118196, 120586−8
MICONEX '83; Shanghai, China, 12-16 April 1983, *(China Instrument Soc.; ISA; Soc. Instrument & Control Engrs)* [Research Triangle Park, NC, USA: ISA 1983] 117146, 117167, 117178−9, 117195, 117200, 117217, 117223, 117256, 117291, 117305, 118263, 118314, 118666, 118683, 118697−9, 120710, 120747, 120797, 120842, 120983, 121056−7, 121410−12
Nuclear power plant control and instrumentation; Munich, Germany, 11-15 Oct. 1982, [Vienna, Austria: IAEA 1983] 116928 (introductory abstract), 117657−71, 117684−91
Optical sensing techniques, benefits, costs; Teddington, Middx., England, 7-8 Dec. 1982, *(Inst. Measurement & Control; IEE)* [1983] 116915 (introductory abstract), 117207, 117220−1, 118193, 118264, 118278
OPTICS 82, ECOSA 82; Edinburgh, Scotland, 7-10 Sept. 1982, *(SPIE)* [1983] 116913 (introductory abstract), 116940, 116945, 117215, 117219, 117225−7, 117233, 117244−5, 117297, 117847, 118067−72, 118079−80, 118083−5, 118096−101, 118105, 118114, 118122, 118150, 118170−2, 118182−5, 118197, 118207, 118227, 118238−9, 118242−3, 118250−3, 118255−6, 118258, 118261−2, 118277, 118304−5, 118309, 118535, 118752, 119307, 120171, 120838, 120841, 120849, 120949, 120976−8, 121063−5, 121370, 121533, 121536, 121539−40, 121546
Physics and chemistry of mercury cadmium telluride; Dallas, TX, USA, 8-10 Feb. 1983, *(Army Res. Office; American Vacuum Soc)* [1983] 116917 (introductory abstract), 118803, 118948, 119009, 119024, 119040, 119052, 119080, 119270, 119279, 119284, 119353, 119426−8, 119501−3, 119594, 119624−5, 119632, 119645, 119693−4, 119723−4, 120002, 120023, 120042−3, 120244, 120251−2, 120266, 120316, 120464−5, 120698
Physics and chemistry of polymer conductors; Les Arcs, France, 11-15 Dec. 1982, [June 1983] 116922 (introductory abstract), 117137, 118021−2, 118212, 118903−15, 119042−5, 119099, 119140−2, 119151, 119273, 119283, 119286, 119311, 119408−17, 119474−6, 119490, 119513−15, 119529, 119536−8, 119553−62, 119603−10, 119636, 119653−7, 119671, 119704, 119728−30, 119893−900, 119911−12, 119916, 119925−7, 119935−8, 119950−1, 119957−8, 119998−20000, 120018, 120025, 120053−66, 120102, 120107−8, 120138, 120218, 120297−300, 120609−14, 120627−31, 120643−5, 120703, 120732−5, 120738
Physics and chemistry of synthetic and organic metals; Les Arcs, France, 14-18 Dec. 1982, [June 1983] 116923 (introductory abstract), 117898, 118825, 118893, 118925, 118930, 118945, 118953−4, 118982−4, 118993−9001, 119005−6, 119032, 119136, 119177−8, 119236, 119382−4, 119388−95, 119401−3, 119438−54, 119459, 119479−85, 119516, 119519, 119539−40, 119563−89, 119611−12, 119672, 119675−8, 119738−46, 119753, 119756−62, 119765−6, 119768, 119775, 119787, 119803, 119810−12, 119824−5, 119838−9, 119901, 119907, 119913, 119917−18, 119928, 119939−42, 120067−76, 120233−4, 120270, 120615−17, 120632, 120646
Radionuclide metrology; Geel, Belgium, 16-17 May 1983, [1983] 116933, 117538, 117542−4, 117547−50, 117556−7, 117718, 117724, 117736, 120796, 121003
Rare earth research; Tallahassee, FL, USA, 18-21 April 1983, [1983] 117918, 118010, 118175, 118950, 118959, 118961, 118970−7, 119420, 119498, 119798, 119808, 119873−5, 120045, 120134−5, 120274, 120331, 120503−4, 120637, 120668−9, 120755
Scanning electron microscopy 83; Dearborn, MI, USA, 17-22 April 1983, *(Scanning Electron Microscopy Inc)* [1983] 116926 (introductory abstract), 116938, 117275, 117289−90, 118823, 119328, 120197, 120213, 120512, 121082−3, 121184
Solar flares; Tokyo, Japan, 5-8 Oct. 1982, *(Japan Soc. Promotion of Sci.; U.S. Nat. Sci. Found)* [1983] 116925 (introductory abstract), 121506−7, 121652−71
Strain patterns in rocks; Rennes, France, 13-14 May 1982, [1983] 116911 (introductory abstract),
Thermionic valves; Garmisch-Partenkirchen, Germany, 18-20 May 1983, [1983] 121005
Upper and middle atmosphere structure; Leeds, England, 23-27 Aug. 1982, [1983] 116924 (introductory abstract), 121340−4, 121418−21, 121649

CORPORATE AUTHOR INDEX

AGARD, Neuilly sur Seine, France
Wind tunnel flow quality and data accuracy requirements, AGARD-AR-184. 118696

Atomic Energy Canada Ltd., Chalk River, Ont.
Ballooning of thin-walled tubes with an azimuthal temperature gradient, AECL-7799. 117625
Canadian nuclear fuel waste management program, AECL-7787. 117623
Diffusional mass transport phenomena in the buffer material and damaged zone of a borehole wall in an underground nuclear waste vault, AECL-7788. 117621
Effect of localized waste-container failure on radionuclide transport from an underground nuclear waste vault, AECL-7796. 117620
Effects of ionizing radiation and review of the Young-Woollard document, AECL-8061. 121022
High-level waste glass field burial tests at CRNL: The effect of geochemical kinetics on the release and migration of fission products in a sandy aquifer, AECL-6836. 117622
Method of predicting pressure profiles in horizontal 37-element clusters, AECL-8065. 117653
Parameter-sensitivity analysis of near-field radionuclide transport in buffer material and rock for an underground nuclear fuel waste vault, AECL-7801. 117626
Study of the effect of circumferential temperature variations on fuel-sheath strain in an inert atmosphere, AECL-7789. 120389
Testing ENDF/B-V data for thermal reactors (Addendums 1, 2, 3), AECL-7690. 117601

CERN, Geneva, Switzerland
Muon flux measurement with silicon detectors in the CERN neutrino beams, CERN 83-06. 117722

Comm. European Communities, Luxembourg
24th 1982 meteorological yearbook of Ispra, EUR 8538 IT. 116936
Characterization of low and medium level radioactive waste forms, EUR 8663 EN. 117624
Dekontamination von Komponenten stillgelegter Kernkraftwerke fur die freie Beseitigung (Decontamination of components of closed-down nuclear power stations for open air disposal), EUR 8704 DE. 117706
EFOM 12C case studies. Candidate technologies in the European energy systems: United Kingdom case study, EUR 8459 EN. 120715
Hydride storage devices for load levelling in electrical power systems, EUR 7314 EN. 120771
Magnesium hydride for load levelling energy storage, EUR 8507 EN. 120772
Studio della decarburazione e scagliatura nei forni di riscaldo per laminazione a caldo (Study of the decarbunization and scaling ocurring in reheating furnaces for hot rolling), EUR 7816 IT. 120516

Council for Miner. Technol., Randburg, S. Africa
A high-speed, multi-input serial-interfacing system for a computer with simultaneous back-up recording on magnetic tape, M52. 117156

Electr. Power Res. Inst., Palo Alto, CA, USA
Added mass computation for impellers in nuclear power pumps, EPRI-NP-3202. 117650
Analysis of creep rupture data for five multiheat alloys by the minimum commitment method using double heat term centering technique, EPRI-CS-3171. 117615
Analysis of sludge from Indian Point 3, EPRI-NP-3027. 117643
Analysis of test lattice experiments in the light water high-conversion reactor PROTEUS, EPRI-NP-3190. 117617
Assessment, development, and application of LMFBR thermal-hydraulic analysis tools, EPRI-NP-3167. 117596
Chemical cleaning process evaluation - Westinghouse steam generators, EPRI-NP-2987. 117637
COMETHE-IIIJ predictions of the fuel centerline temperatures in the IFA-431, IFA-432, and IFA-513 assemblies, EPRI-NP-2992. 117594
Computer-calculated potential pH diagrams to 300°C. Vol.II: Handbook of diagrams, EPRI-NP-3137. 116935
Computer calculated potential pH diagrams to 300°C. Vol. III: User's guide for the computer program POT-pH-TEMP, EPRI-NP-3137. 117600
Condensate polishing at Surry Nuclear Power Station, EPRI-NP-3037. 117652
Crevice corrosion of lattice support alloys in secondary environments of nuclear steam generators, EPRI-NP-3045. 117647
Design and testing of a laboratory gamma-ray densitometer for two-phase flow, EPRI-NP-2819. 117639
Development of a crack growth algorithm for time-dependent analysis of steam turbine rotors, EPRI-NP-3187. 120430
Evaluation and improvement of PWR secondary-system oxygen control measures, EPRI-NP-3020. 117651
Evaluation of BWR resin intrusions on stress corrosion cracking of reactor structural materials, EPRI-NP-3145. 117618
Evaluation of secondary-system layup and cleanup practices and processes, EPRI-NP-2977. 117638
High-reliability condenser design study, EPRI-CS-3200. 117646
In situ calibration of nuclear plant platinum resistance thermometers using Johnson noise methods, EPRI-NP-3113. 117644
LOCA hydroloads calculations with multidimensional nonlinear fluid/structure interaction. Vol.IV. Fluid/structure interaction application studies, EPRI-NP-1401. 117682
LWR core materials performance program: Progress in 1981-1982, EPRI-NP-3150-SR. 117616

Electronic Reliability Data

A guide to selected components.

Electronic Reliability Data is an accurate, up to date source of numerical data on the reliability of electronic components.

Failure Rates

Precise values are given of failures per million hours of a large number of electronic components from resistors to microcircuits.

Operational Experience

Much of the data is drawn from the analysis and evaluation of actual failures in an industrial environment.

Environmental Factors

The effect of many different environmental factors have been evaluated and their effect on failure rates determined. Such factors include:- Electrical stress ratio, Temperature, Age, Storage.

Applications

The effects of different applications have been quantified so that failure rates can be determined for the use of components in applications varying from digital computers to rocket launches.

Electronic Reliability Data provides an accurate assessment of the likely failure rate of components and is the most complete and up to date source of numerical data available. A concise guide to the subject of reliability is given and there is an extensive bibliography of over 700 references with abstracts, to the most recent literature on the subject.

Electronic Reliability Data: A guide to selected components.

Components covered: Resistors, Capacitors, Diodes, Transistors, Thyristors, Microcircuits.

225 pages, ISBN 852962 40 1 £125 ($300 Americas only)

Ion Solid Interactions

"The number of actual and potential technological applications of ion-solid interactions is immense, and a work of reference, such as this, allowing fast discovery of the existence and publication details of virtually all scientific papers in this field must be of considerable value to industrial government and university laboratories throughout the world.

This is not only a very valuable work of reference for scientists and technologists in this field of research, but also an important contribution to the research field itself.....purchase of this bibliography should not be delayed."

D.W. Palmer
writing in the Journal of Nuclear Materials, Vol. 96, No. 3 February, p.375 (1981)

Ion Solid Interactions was compiled by Bell Laboratories in conjunction with the Institute for the Study and Applications of Atomic Collisions of the State University of New York at Albany.

Ion Solid Interactions 3 Vols. 1652 pages, over 12,000 references,

IEE Telecommunications Series

Published by Peter Peregrinus Ltd. on behalf of the Institution of Electrical Engineers

1 Telecommunication networks

J. E. Flood (Ed.)

This volume describes the characteristics of national telecommunication networks and develops methods for new planning. To explain the planning methods used, sufficient background is given in transmission, switching, traffic, engineering economics and modelling and these are illustrated by case studies. The book deals mainly with telephone networks; however chapters on telegraphy, data transmission and mobile radio are included.

432 pp., 234 × 156 mm, 138 diagrams, casebound, 1975, ISBN 0 901223 65 4, UK £12.60, overseas £14.75

2 Principles of telecommunication traffic engineering

D. Bear

This volume deals with the mathematical theory of traffic distribution and congestion in telecommunication networks, and its application to the engineering of switching systems. Subjects covered include traffic measurement, traffic prediction and simulation, lost-call theory, waiting-call systems and non-blocking networks.

220 pp., 234 × 156 mm, 58 diagrams, casebound, 1975, ISBN 0 901223 75 1, UK £11, overseas £12.90

3 Programming electronic switching systems

M. T. Hills and S. Kano

Following a discussion of the main programming techniques used for the control of switching systems, this volume describes the attributes needed for a suitable language. Subjects covered include an introduction to s.p.c. systems, principles of programming s.p.c. exchanges, characteristics of telecommunication programming and languages features and their relevance to telecommunication programming.

207 pp., 234 × 156 mm, casebound, ISBN 0 901223 80 8, March 1976, UK £11.90, overseas £13.90

4 Digital transmission systems

P. Bylanski and D. G. W. Ingram

A comprehensive view of the transmission aspects of communication systems using digital techniques is presented in this book. There is an emphasis on systems and technology that have found acceptance in the communication industry or are likely to become significant in the future.

368 pp., 234 × 156 mm, casebound, ISBN 0 901223 78 6, April 1976, UK £13.80, overseas £16.00

5 Angle Modulation – the theory of system assessment

J. H. Roberts

This volume covers the performance of threshold-extending devices, the phase-lock loop (in both its analogue and discrete forms), spectra, the distortion introduced by first filtering an analogue f.m. signal and then demodulating it, and variants on the conventional f.m. receiver that improve very poor signal/noise ratios.

288 pp., 216 × 138 mm, casebound, ISBN 0 901223 95 6, May 1977, UK £12.75, overseas £14.90

CUMULATIVE INDEXES

Cumulative indexes are available for *Physics Abstracts*, *Electrical & Electronics Abstracts* and *Computer & Control Abstracts*, for both authors and subjects. These cumulations generally cover a period of four years, with the exception of *Computer & Control Abstracts* where the initial volume covered the period 1966–68. The table below shows the prices and periods for the two types of cumulative index.

	PHYSICS ABSTRACTS		ELECTRICAL & ELECTRONICS ABSTRACTS		COMPUTER & CONTROL ABSTRACTS

OTHER INSPEC SERVICES

SDI

(Selective Dissemination of Information.) This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm × 100 mm (6″ × 4″) cards.

TOPICS

This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES

Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.

Summary Classification

The full classification and contents are given at the front of the journal, followed by an **Alphabetical Index** to the subjects covered

00.00	**General**
01.00	Communication, Education, History and Philisophy
02.00	Mathematical Methods in Physics
03.00	Classical and Quantum Physics; Mechanics and Fields
04.00	Relativity and Gravitation
05.00	Statistical Physics and Thermodynamics
06.00	Measurement Science, General Laboratory Techniques, and Instrumentation Systems
07.00	Specific Instrumentation and Techniques of General Use in Physics
10.00	**The Physics of Elementary Particles and Fields**
11.00	General Theory of Fields and Particles
12.00	Specific Theories and Interaction Models; Particle Systematics
13.00	Specific Reactions and Phenomenology
14.00	Properties of Specific Particles and Resonances
20.00	**Nuclear Physics**
21.00	Nuclear Structure
23.00	Radioactivity and Electromagmetic Transitions
24.00	Nuclear Reactions and Scattering: General
25.00	Nuclear Reactions and Scattering: Specific Reactions
27.00	Properties of Specific Nuclei listed by Mass Ranges
28.00	Nuclear Engineering and Nuclear Power Studies
29.00	Experimental Methods and Instrumentation for Elementary-Particle and Nuclear Physics
30.00	**Atomic and Molecular Physics**
31.00	Theory of Atoms and Molecules
32.00	Atomic Spectra and Interactions with Photons
33.00	Molecular Spectra and Interactions with Photons
34.00	Atomic and Molecular Collision Processes and Interactions
35.00	Properties of Atoms and Molecules; Instruments and Techniques
36.00	Studies of Special Atoms and Molecules
40.00	**Classical Areas of Phenomenology**
41.00	Electricity and Magnetism; Fields and Charged Particles
42.00	Optics
43.00	Acoustics
44.00	Heat Flow, Thermal and Thermodynamic Processes
46.00	Mechanics, Elasticity, Rheology
47.00	Fluid Dynamics
50.00	**Fluids, Plasmas and Electric Discharges**
51.00	Kinetic and Transport Theory of Fluids; Physical Properties of Gases
52.00	The Physics of Plasmas and Electric Discharges
60.00	**Condensed Matter: Structure, Thermal and Mechanical Properties**
61.00	Structure of Liquids and Solids; Crystallography
62.00	Mechanical and Acoustic Properties of Condensed Matter
63.00	Lattice Dynamics and Crystal Statistics
64.00	Equations of State, Phase Equilibria, and Phase Transitions
65.00	Thermal Properties of Condensed Matter
66.00	Transport Properties of Condensed Matter (Nonelectronic)
67.00	Quantum Fluids and Solids; Liquid and Solid Helium
68.00	Surfaces and Interfaces; Thin Films and Whiskers
70.00	**Condensed Matter: Electronic Structure, Electrical, Magnetic, and Optical Properties**
71.00	Electron States
72.00	Electronic Transport in Condensed Matter
73.00	Electronic Structure and Electrical Properties of Surfaces, Interfaces, and Thin Films
74.00	Superconductivity
75.00	Magnetic Properties and Materials
76.00	Magnetic Resonances and Relaxation in Condensed Matter; Mossbauer Effect
77.00	Dielectric Properties and Materials
78.00	Optical Properties and Condensed Matter Spectroscopy and other Interactions of Matter with Particles and Radiation
79.00	Electron and Ion Emission by Liquids and Solids; Impact Phenomena
80.00	**Cross-Disciplinary Physics and Related Areas of Science and Technology**
81.00	Materials Science
82.00	Physical Chemistry
86.00	Energy Research and Environmental Science
87.00	Biophysics, Medical Physics, and Biomedical Engineering
90.00	**Geophysics, Astronomy and Astrophysics**
91.00	Solid Earth Geophysics
92.00	Hydrospheric and Atmospheric Geophysics
93.00	Geophysical Observations, Instrumentation, and Techniques
94.00	Aeronomy and Space Physics
95.00	Fundamental Astronomy and Astrophysics, Instrumentation and Techniques and Astronomical Observations
96.00	Solar System
97.00	Stars
98.00	Stellar Systems; Galactic and Extragalactic Objects and Systems; The Universe
